## SUP'R'TERMInAL

## SUP'R'TERMINAL IS AN 80 COLUMN BY 24 LINE PLUG-IN COMPATIBLE BOARD FOR THE APPLE II COMPUTER

## SPECIFICATIONS \& FEATURES

- 80 Columns by 24 lines, upper and lower case; all 128 ASCII characters.
- Upper and Lower case data entry using the APPLE II keyboard.
- Includes an Upper and Lower case $5 \times 8$ dot matrix ASCII character set, and inverse alpha characters.
- Expands existing keyboard for more ASCII characters
- Character set can be user definable
- Includes VBC ${ }^{\text {rm }}$ (video balance circuit) which enables the use of displaying 80 columns on an inexpensive 8 MHz CRT monitor
- Works with LEEDEX monitor (version 2.2) and other inexpensive CRT monitors
- Shift Lock Feature
- KEYPRESS function for PASCAL programs supplied
- Works with APPLE PASCAL and APPLE BASIC
- Incorporates PASCAL and BASIC control characters
- Follows protocols of PASCAL and BASIC operating systems
- ALL monitor-type escapes are valid
- Compatible with ALL APPLE II peripherals.
- Effective baud rate greater than 10,000; fast scrolling and clearing
- Can be used with APPLE II communication interface board to act as self contained terminal for timesharing or other applications. Terminal program supplied when used with a D.C. Hayes micromodem.
- 3K bytes of bank switched static ram
- 2 K bytes of ROM
- The only board with continuous direct memory mapped screened ram.
- The only board that interprets VTABS by firmware (version 2.2)
- The only board with an adjustable scrolling window.
- The only 80 column board that is synchronous with the APPLE II
- Fully programmable cursor
- Conversion program supplied to modify existing APPLESOFT programs to work with SUP'R'TERMINAL (automatically converts HOME,CALL-936 and VTABS) (version 1.0)
- Works with the new Easywriter and APPLE PI word processors.
- Uses less current on the +5 V supply than any other 80 column board
- Works with CORVIS hard disc system

# Mountain Computer makes more peripherals for the Apple Computer than Anybody. 

## and

INTROL X-10
Inteiligent Home Controller for lights and appliances. Real-time schedules and energy conservation. Complete applications software package. Home security with random scheduler. Power usage accounting package for home energy cost control. No wiring required

APPIE CLOCK
Real-time and date information. Interrupts permit Foreground/Background operation of two programs simultaneously. Battery back-up. Crystal-controlled for $\pm .001 \%$ accuracy. Onboard ROM for easy access from BASICs. Supports PASCAL. Time from one millisecond to one year

## 

Input/Output Speech Digitizer. Permits talking programs. I/O capability allows interactive programs with speech-prompted inputs. Use output for speech directed activities in business systems, announcements in a controlroom, or sound effects in entertainment programs. Easy to use because input as well as output is under user control with special software operating system.

## ROMWRITER

Program your own EPROMs. Create your own firmware. Programs 2K, 27165 V EPROMs. Disk software package provides easy EPROM programming. EPROMs are verified after BURN. RUN your programs from on-board socket or install them on ROMPLUS +

## ROMPIUS+

More power for your system through firmware. Six sockets accept 2716 EPROMs or ROM equivalents. Six or any combination can be used at once. Scratch-pad RAM and two TTL connectors. Special 2 K ROMs available for powerful system enhancement: Keyboard Filter ROM-COPYROM-Others coming soon.

## Musicsystem

Sophistication previously available only on experimental mini and mainframe computer synthesizers. Digital instrumental music synthesizer system. 16 voices in stereo. Instrument definitions simulate the sound of real instruments-and more. Fully programmable waveforms. Envelope Control. Composition system-sheet music input using standard music notation. Chords and multi-part scoring up to 16 voices. A true instrument that anyone with an Apple can play.

## $A / D+D / A$

16 channels analog to digital input. 16 channels digital to analog output. Eight bit resolution. Super-fast $9 \mu$ sec. conversion time. Monitor and output to the real world. All on one card.
a place to put them

## EXPANSION CHASSIS

By popular demand Eight more slots for your Apple. Attractive sturdy enclosure. Its own heavy duty power supply. Easy to use. Address cards in Expansion Chassis the same way as in your Apple. Only one additional command to specify in Apple or in Expansion Chassis. Compatible with all Apple peripherals.

At last! An intelligent, high-quality device for data entry from user-marked cards. Implement BASIC programming, examination scoring, inventory maintenance and other applications requiring off-line data preparation for batch entry later. Connects to any computer having RS-232 interface. Software and cards are available for jobs in business, science and education.
MOUNTAIN COMPUTER has the most comprehensive line of Apple peripherals available. Anywere. From anybody. We know the Apple inside and out and are committed to providing. the most innovative and unique products to expand and enhance its capabilities and use. After all, we were the first company to make an Apple peripheral - except Apple Computer.

Available at Apple Dealers worldwide

# DATA CAPTURE 4.0 

The most advanced and easiest to use telecommunications program for use with the MICROMODEM $\| \mathbb{\infty}$ or the Apple COMMUNICATIONS CARD®
Q. Will DATA CAPTURE 4.0 work with my Communications Card ${ }^{\text {TW }}$ and a modem?
A. It makes using the Comm. Card almost as easy as using the Micromodem II.
Q. Do I need an extra editor to prepare text for transmission to another computer?
A. No. DATA CAPTURE 4.0 gives you control of the text buffer. You can use DATA CAPTURE 4.0 to create text.
Q. Can I edit the text I have prepared?
A. Yes. You can insert lines or delete any lines from the text.
Q. How about text I have captured. Can I edit that?
A. As easily as the text you have prepared yourself. You can delete any lines you don't want to print or save to a disk file. You can also insert lines into the text.
Q. Just how much text can I capture with DATA CAPTURE 4.0?
A. If the system with which you are communicating accepts a stop character, most use a Control S, you can capture an unlimited amount of text.
Q. How does that work? And do I have to keep an eye on how much I have already captured?
A. When the text buffer is full the stop character is output to the other system. Then DATA CAPTURE 4.0 writes what has been captured up to that point to a disk file. This is done automatically.
Q. Then what happens?
A. Control is returned to you and you can send the start character to the other system. This generally requires pressing any key, the RETURN key or a Control $Q$.
Q. Are upper and lower case supported if I have a Lower Case Adapter?
A. Yes. If you don't have the adapter an upper case only version is also provided on the diskette.
Q. Do I need to have my printer card or Micromodem $\|^{\text {tw }}$ or Communications Cardim in any special slot?
A. No. All this is taken care of when you first run a short program to configure DATA CAPTURE 4.0 to your system. Then you don't have to be concerned with it again. If you move your cards around later you can reconfigure DATA CAPTURE 4.0 .
Q. Do I have to build a file on the other system to get it sent to my Apple?
A. No. If the other system can list it you can capture it:
a. How easy is it to transmit text or data to another system?
A. You can load the text or data into DATA CAPTURE 4.0 from the disk and transmit it. Or you can transmit what you have typed into DATA CAPTURE 4.0.
a. How can I be sure the other system receives what I send it?
A. If the other system works in Full Duplex, it 'echoes' what you send it, then DATA CAPTURE 4.0 adjusts its sending speed to the other system and won't send the next character until it is sure the present one has been received. We call that 'Dynamic Sending Speed Adjustment'.
Q. What if the other system works only in Half Duplex.
A. A different sending routine is provided for use with Half Duplex systems.
Q. What if I want to transmit a program to the other system?
A. No problem. You make the program into a text file with a program that is provided with DATA CAPTURE 4.0, load it into DATA CAPTURE 4.0 and transmit it.
Q. What type files can I read and save with DATA CAPTURE 4.0?
A. Any Apple DOS sequential text file. You can create and edit EXEC files, send or receive VISCIALC(c) data files, send or receive text files created with any editor that uses text files.
Q. Can I leave DATA CAPTURE 4.0 running on my Apple at home and use it from another system?
A. Yes. If you are using the Micromodem IIw you can call DATA CAPTURE 4.0 from another system. This is handy if you are at work and want to transmit something to your unattended Apple at home.
Q. Where can I buy DATA CAPTURE 4.0?
A. Your local Apple dealer. If he doesn't have it ask him to order it. Or if you can't wait order it directly from Southeastern Software. The price is $\$ 65.00$. To order the Dan Paymar Lower Case Adapter add $\$ 64.95$ and include the serial number of your Apple.
Q. If I order it directly how can I pay for it?
A. We accept Master Charge, Visa or your personal check. You will get your order shipped within 3 working days of when we receive it no matter how you pay for it. Send your order to us at the address shown or call either of the numbers in this advertisement. You can call anytime of day, evening or Saturdays.
Q. I bought DATA CAPTURE 3.0 and DATA CAPTIJRE 4.0 sounds so good I want this version. What do I do to upgrade?
A. Send us your original DATA CAPTURE 3.0 diskette and documentation, the $\$ 35.00$ price difference and $\$ 2.50$ for postage and handling. We will send you DATA CAPTURE 4.0 within 3 working days of receiving your order.
Q. What kind of support can I expect after I buy it?
A. If you have bought from Southeastern Software in the past you know we are always ready to answer any questions about our products or how to use them.

## Requires DISK $\|^{\circ \pi}$, Applesoft $\|{ }^{(4 \times}$ and 48 K of Memory

## PRESIDENT'S CORNER

Like Apple Computer Inc., the International Apple Core's growth has been phenomenal. In one year our membership is over 180 clubs, 23 associates, and 18 sponsors. The IAC now represents over 18,000 Apple owners.

There is so much we would like to accomplish now, for you, our members, but it takes time in a volunteer organization to find people who are willing to help. In time, as we increase our financial foothold, this will be easier by hiring individuals to perform the work. Financial stability is the current goal of the Board of Directors and officers. The IAC funding, at this time, comes almost entirely from the sales of THE APPLE ORCHARD. If you haven't subscribed yet, you will find a form in this issue - remember your subscription helps support the IAC and you get a great publication concerning the Apple Computer.

At a recent Board of Directors meeting, the date and place for the 1981 ANNUAL GENERAL MEETING was set, and will be held in Chicago, III. on May 2nd \& 3rd in conjunc-
tion with NCC. More information as to place and times for the meeting and seminars will be sent to all clubs as plans are finalized. All member clubs should start to plan on sending, if they wish, a representative to this meeting remember your club has a vote as to the direction of the IAC - we want your input.

Like in 1980, we plan to have technical seminars from Apple experts at the meeting. They will be video taped and be available to all clubs for showing. As we obtain confirmation from these experts, we will inform you.

One of the items that came out of the Board meeting was the implemention of a new BULLETIN which we will publish every month and send to all members. The purpose of this is to advise you of what the IAC is doing, timely announcements, and information that can not wait for our quarterly publication.

Ken Silverman, President International Apple Core

## INTERNATIONAL APPLE CORE SPONSORING MEMBERS

I.A.C. sponsors are a special breed. They are the organizations who along with our advertisers, contribute to and support many I.A.C. activities. In addition, they will provide us with application notes concerning their products - notes that will benefit users by showing new and different ways to utilize their products or production/software modifications that have been made to upgrade their product. When considering a software or product purchase, we request that they be given special consideration.
Those organizations that would like to become sponsors or who would like additional information about the benefits and advantages of becoming a sponsoring member are urged to contact Michael Weinstock, Vice-President, International Apple Core, P.O. Box 976, Daly City, CA 94017.

A list of sponsoring members, current through the first of September, 1980, appears below.

## kill two birds <br> with one stone? <br> If you have an Apple" and you want to internard for

 parallel and serial devices, we have a boar you that will do both. It's the AIO."
## Serial Interface.

The RS-232 standard assures maximum compatibility with a variety of serial devices. Apple* ample, with the A1O you can connaracters per line to a video terminal to ge to use time-sharing instead of 40 , a modern for hard copy. The services, or a is software programmable, serial interface is sottware progrines, and features three handshitch to select from includes a rotary swates. On-board firmware provides a powerful driver watine so you won't need to write any

## Parallel Interface.

This interface can be used to connect your Apple* to a variety of parallel printers. The programmable $\mathrm{I} / \mathrm{O}$ ports have enously with to handle two printers s. The users manual handshaking control. Fing for controlling includes a software if you prefer, a parparallel printers or, is available in firmallel driver routine is And printing is ware as an option. An for this general
purpose parallel interface.
Two boards in one. The AIO is the only board on the market that en do both at the same to both serial and parallel devicive design and solid value that's been time. That's the kind of innove the beginning of personal and parallel going into SSM products semplete with serial PROM's, so software listings.

The AIO comes complete documentation includuter store or contact
 of a carrier.

Many people have called with the same questions about the AIO. We'll answer those and a few more here.

Q: Does the AIO have hardware handshaking? A: Yes. The serial port accommodates 3 types - RTS, CTS, and DCD. The parallel port handles ACK, $\overline{\mathrm{ACK}}$, BSY, STB, and STB.
Q: What equipment can be used with the AIO?
A: A partial list of devices that have actually been tested with the AIO includes: IDS 440 Paper Tiger, Centronics 779, Qume Sprint 5, NEC Spinwriter, Comprint, Heathkit H14, IDS 125, IDS 225, Hazeltine 1500, Lear Siegler ADM-3, DTC 300, AJ 841.
Q: Does the AIO work with Pascal?
A: Yes. The current AIO serial firmware works great with Pascal. If you want to run the parallel port, or both the serial and parallel ports with Pascal, order our "Pascal Patcher Disk."
Q: What kind of firmware option is available for the parallel interface?
A: Two PROM's that the user installs on the AIO card in place of the Serial Firmware PROM's provide: Variable margins, Variable page length, Variable indentations, and Auto-line-feed on carriage return.
Q: How do I interface my new printer to my Apple using my AIO card?
A: Interconnection diagrams for many popular printers and other devices are contained in the AIO Manual. If your printer is not mentioned, please contact SSM's Technical Support Dept. and they will help you with the proper connections.
Q: I want to use my Apple as a dumb terminal with a modem on a timesharing service like The Source. Can I do that with the AIO? A: Yes. A "Dumb Terminal Routine" is listed in the AIO Manual. It provides for full and half duplex, and also checks for presence

Q: What length cables are provided?
A: For the serial port, a 12 inch ribbon cable with a DB-25 socket on the user end is supplied. For the parallel port, a 72 inch ribbon cable with an unterminated user end is provided. Other cables are available on special volume orders.

The AIO is just one of several boards for the Apple that SSM will be introducing over the next year. We are also receptive to developing products to meet special OEM requirements. So please contact us if you have a need and there is nothing available to meet it.

## PRINT FRE(ed)

by Val J. Golding

In Nibble Magazine number 6, editor Mike Harvey wrote an eloquent and thought-provoking editorial on the subject of bootlegging and protected programs, which we suggest you read. Nibble's address may be found in their advertisement on Page 10.

Mike wrote of having heard that a user group had "broken" the Visicalc "non-copy" locks and was making copies of Visicalc for its members, an appalling thought. All IAC member clubs, in making their application to join, agree they will not be a party to the copying of copyrighted programs. Unfortunately, this is a difficult area to police, and word of mouth about illegal copies, which we too have heard, is not sufficient grounds for the expulsion of a member club.

This entire matter is regrettable and has already taken its toll in the
form of higher prices and "protected", harder to copy, software. It appears that software manufacturers generally accept that copying is inevitable, which has resulted in substantial increases in purchase prices (which must be amortized over a very short period to recoup costs before many illegal copies get out) and an everincreasing number of software products relying on numerous different protection schemes.

The so-called "non copyable" diskettes can, of course, be copied by anyone endowed with sufficient skill and expertise in Apple DOS, but by and large they reduce the numbers of software thefts. However, in many cases, protected diskettes place an unfair burden on the legitimate software purchaser, in the form of lengthy delays in obtaining replacement diskettes,
and the further cost of paying a service charge for same, sometimes at a much more than nominal figure.

Again, this situation is regrettable, but it is also something we have brought upon ourselves by knowingly accepting and using, from whatever sources, bootlegged programs. If the situation gets too far out of hand, the decreasing returns to the talented programmers who have created such excellent pieces of software as Visicalc and Program Line Editor will turn their talents to other fields, and we shall be the poorer for it.

It is not too late to stem, if not turn, the tide. When you accept and use a piece of pirated software, you are an accessory after the fact. It makes no difference whether we are talking about a $\$ 9.95$ game or a $\$ 700$ Controller. Theft is theft, and we can not mince words. You have paid how much - \$1000, \$2000, $\$ 3000$ - for your Apple II, one of the world's finest and most powerful microcomputers, Is it worth the resultant damage to the industry to save a few bucks?

If you have an Apple, Pet or TRS-80 microcomputer,* you can have fantasy at your fingertips with Epyx computer games from Automated Simulations.

Like me, you're probably really into games, all sorts of games. But an Epyx game is more than a game - it's an experience, and it's a chance to use your computer for something other than work. The great thing about Epyx games is that you have a choice. Whether you're a beginner or an expert, you can find games that are easy to learn. Challenging. Fun to play for twenty minutes or
"Ican rescue ten prisoners slay a mad wizard, retrieve stolen treasure and save money. So can you!"
$\qquad$
hours at a time. You can play these games over and over, because you're constantly trying new tactics and strategies.
l've already entered and re-entered a world of monsters and misfits, demons and dwarves, trials, tribulations and treasures with a game called "Temple of Apshai". Now it's my chance to have fun with three more games from Automated Simulations... and I can save money, too!

With "Datestones of Ryn" and "Morloc's Tower," I get to escape from booby-trapped mazes, find more treasures and zap more monsters. And with "Rescue at Rigel," I get to outwit the nasty High Tollah and free 10 prisoners.

Automated Simulations has a special offer on "Datestones of Ryn", "Morloc's Tower" and "Rescue at Rigel". Buy all three for just $\$ 49.95, a \$ 70.00$ value. This offer is available for a limited time only, so don't wait to be a hero. See your local dealer today, Or you can order these games by phone. Dial ( 800 ) 824-7888, operator 861 . In California, (800) 852-7777, operator 861 .

## The tricks our IBMS software can make your Apple* do!

The small businessman has never had it so good, or so easy. Because now there's our Interactive Business Management System (IBMS) . . . which lets your micro-computer perform like a larger unit, so you can mind, monitor and manage every aspect of your business accounting.

## A Full System

While it's extremely easy to use, IBMS is a fufl system to handle the full job. The ten program modules can generate everything from the original invoice to the final profit/loss statements, plus many peripheral operations. The special Menu includes: System Start-up. Accounts Receivable. Accounts Payable. Perpetual Inventory. Payroll. Fixed Assets. General Ledger. Plus Mailing Labels, and an Appointments Calendar.

## Save Maximum Time

Since IBMS is a totally interactive system, multipleentering of data is eliminated. Make an entry in one area and it automatically updates all concerned areas! No duplication of effort, no wasted time, no problems.

## Proven. And then some.

It took 3 years to develop IBMS, including shakedown and on-site testing. As a result, it's reliable and versatile and its documentation is thorough and easily understandable. No wonder we consider it 5 years ahead of anything else available to the Apple II user.

## Introductory Offer

The complete IBMS software package, on minifloppy disks, documentation, and the backing of Programma International, Inc is offered for a limited time at the Introductory Price of \$1495.00. You'll be amazed how it can satisfy you . . . by saving you time, effort, money and employee growth.

By the Editor

Select One. The title of this feature was well chosen. This is the section to which the reader may turn and obtain a tad more information about the featured stories in this magazine, a few tantalizing hints of the valuable material inside.

Our first task normally is to dig into the feature story and then move on to some of the interesting articles, but this time the reader will have to wait for a moment as we take time to talk a bit about the International Apple Core, its publication Apple Orchard, and to chide, in fact, scold, some of the IAC member clubs.

The Orchard is the official publication of the IAC, a group formed to serve the needs of Apple Computer user groups world wide, and representing near 20,000 individual Apple users, a most respectable number, and a fair share of all Apples sold. The IAC offers a multitude of services to its membership, much of it either free or on a cost basis. Major funding for IAC activities is through the sales of advertising and bulk dealer copies of the Orchard.

Producing the Orchard requires a constant flow of editorial material, which is generated from three primary sources: material from Apple Computer, Inc., for the Contact section, reprints of particularly significant articles from the various club newsletters, and fresh stories and programs submitted by individuals, and user groups on behalf of their members. A page rate of $\$ 25$ per printed page is paid upon request.

As we are responsible to provide services to our member clubs, so too are they obligated to furnish the Orchard with material, and it is to this subject we must now address ourselves. There can not be another issue of the Orchard without a vast influx of suitable material, and as you read this, the deadline is already upon us. A small effort by each member club would provide hundreds of pages worth of stories in a matter of days.

Featured in this Winter issue of the Apple Orchard is Pete Rowe's "A BASIC to Machine Language Interface". Pete's article and four programs show how to use DOS's RWTS routines from both Integer and Applesoft Basics, a quite simple procedure, once you understand how it all fits together.

The lead story in Apple Computer's Contact section by J.D. Eisenberg and Andy Hertzfeld, "Inside the Silentype Firmware", is similarly interesting, just what you need to know to perform some fancy stunts with your Silentype printer.

Bob Clardy, along with a host of others from Apple Pugetsound have come up with some neat modifications to Mark Capella's "Applesoft Program Listing Formatter" which previously appeared in Call -Apple, while Frank Evans from the Apple Portland group presents some noteworthy instructional information in "Using USR", the little known Applesoft function, and Randy Hyde of the Original Apple Core in Los Angeles has contributed "Locations of Interest
to Pascal and 6502 Users". In addition, our overseas clubs are represented by Ron Haines from the New South Wales, Australia group with "Notes About the UCSD Assembler".

Rounding out the Contact section, "Woz", one of the original partners of Apple Computer, Inc., offers a short Assembly Language "Binary to Decimal Shortcut", Jo and Charlie Kellner demonstrate "Converting Strings to Numeric Variables" in Pascal, and other stories feature the Dow-Jones package, "Saving and Loading Arrays in Applesoft" and a collection of other subjects of interest.

## FRUIT OF THE EARTH

by Kyrene Gould BL Systems, LTD. Birmingham, England

Slowly the dusky dawn lists and scrolling upwards, gently reveals the bruised crimson of the ever present Apple.
With speed of ten, it rises, to output its knowing silicon rays into the darkened atmosphere of minds.
Manipulable, yet master, it saves those who would run, and works with careful control, characterizing their output, and filing for future reference, their mode and format.

Thus daily, it continues, monitoring, and driving forward manipulating, dating and translating.
Ever constant in its bitten, colored hue.
Ever present at the core of all memory now and in future time.
It computes unceasingly, until, with day's demise, its lifetime is broken with flick of switch,
and it hangs,
once more lifeless, until tomorrow's dawn.

# "NIBBLE IS TERRIIIC" (For Your Apple) 

NIBBLE IS: The Reference for Apple computing!
NIBBLE IS: One of the Fastest Growing new Magazines in the Personal Computing Field.

NIBBLE IS: Providing Comprehensive, Useful and Instructive Programs for the Home, Small Business, and Entertainment.<br>NIBBLE 18: A Reference to Graphics, Games, Systems Programming Tips, Product News and Reviews, Hardware Construction Projects, and a host of other features.

NIBBLE IS: A magazine suitable for both the Beginner and the Advanced Programmer.
Each issue of NIBBLE features significant new Programs of Commercial Quality. Here's what some of our Readers say:

- "Certainly the best magazine on the Apple II"
- "Programs remarkably easy to enter"
- "Stimulating and Informative; So much so that this is the first computer magazine I've subscribed to!"
- "Impressed with the quality and content."
_ "NIBBLE IS TERRIFIC!"
In coming issues, look for:
Numeric Keypad Construction Lab $\square$ Assembly Language Programming Column Pascal Programming Column $\square$ Data Base Programs for Home and Business
Personal Investment Analysis $\square$ Electronic Secretary for Time Management
The GIZMO Business Simulation Game
And many many more!
NIBBLE is focused completely on the Apple Computer systems.
Buy NIBBLE through your local Apple Dealer or subscribe now with the coupon below.
Try a NIBBLE!

# A BASIC TO MACHINE LANGUAGE INTERFACE 

by Pete Rowe<br>Computer-Advanced Ideas, Berkeley

The Integer and Applesoft Basic languages provide good working environments for creating structured, readable code. But for some applications, neither BASICs can provide a needed function or fast execution speed. I am not beginning to make a case for developing all programs in a more primitive language (on the Apple, 6502 machine or assembly code). But I would like to convince you to use either Integer or Applesoft Basic and machine code together to create a more powerful working environment than either of the languages could provide separately.

Specifically, Integer Basic or Applesoft is well suited for controlling input and output. With the INPUT and PRINT statements, a programmer can easily and quickly code the interactive processes for a given application. But using either BASIC, he could NOT, for example, play a tune using the Apple's speaker or directly access userspecified, random sectors on an Apple II diskette without employing a machine language routine. To reduce all coding to machine language would place an unnecessary burden on the programmer and could result in excessive development time and hard-to-modify software. My proposal: Join an interactive BASIC language shell to a machine language, computational viscera.

To invoke machine code from
either BASIC is easy: Use the CALL statement. In many cases we also need to pass numeric or string data to and from the machine code. In the case of sound generation, we need to pass at least pitch and duration values. There are perhaps three classifiable methods of passing data between BASIC and machine code:
(A) POKEing values directly into memory. Example:
100 INPUT P,D:POKE O,P: POKE 1,D:CALL 768
Refer to page 45 of the Apple II
"Red" Reference Manual, Jan '78
(B) Passing values in fixed locations in the BASIC variable table:

```
O PITCH=0:DUR=0:REM
    MANDATORY FIRST VARIA
        BLE ASSIGNMENT
100 INPUT PITCH,DUR: CALL 768
```

(C) Passing values just by name in the BASIC variable table:
100 INPUT PITCH,DUR: CALL 768:REM NO PREVI OUS ASSIGNMENTS NECESSARY
(A) and (B) above are examples of passing values by location. POKEing, (A), is the simplest method, but is vulnerable to code changes (moving or altering the machine code could change all of the BASIC reference address) and does not
promote very readable software. Passing values in a fixed location is an improvement, but places a constraint on the programmer to assign all the value-passing variables first and in a specified order. Programmer's Aid \#1 uses this method for functions one and eight: Renumber and High-Resolution Graphics. If the programmer wishes to add more than one machine code routine to his BASIC program, using method (B), he would have to modify the second and all successive machine code routines to accept variable placement in diferent positions in the BASIC variable table.

Method (C) is my recommendation: Assign BASIC variables, numeric or string, as needed and at any time. Therefore, the variables can appear anywhere in the BASIC variable table, which is truly passing values by name and not location. This method offers two additional features: (1) Variables not needed for passing data to the machine code need not be assigned by the BASIC program. The machine code can create the missing BASIC variable and assign a value before returning to the BASIC program. And (2), the bulk of the overhead to find and create a BASIC variable is procured from the host language. Namely, the same code that creates and assigns variables during the execution of a BASIC program is used by the machine language code.

The following four source listings demonstrate two functions each in Integer Basic and Applesoft．The first routine supplies the missing CHR \＄function for Integer Basic． The CHR FP routine that follows is included to demonstrate variable passing in Applesoft even though Applesoft already contains a CHR\＄ function．

How to use the CHR function:
(1) Integer Basic
(A) BL.OAD CHR INT,A768
(B) Assign CHR variable a positive number between 128 and 255.
(C) CALL 768
CHR INT has now created and assigned the string variable CHR\$ the ASCII value you assigned to CHR. Note that you could do this in immediate mode or in a program and you do not have to pre-assign or dimension CHR\$ before calling CHR INT.
(2) Applesoft Basic
(A) BLOAD CHR FP,A768
(B) Let \(\mathrm{CH} \$=\prime\) " (phony value)
(C) Assign \(\mathrm{CH} \%\) variable a positive value between 0 and 127.
(D) CALL 768
CHR FP has now created and assigned \(\mathrm{CH} \$\) the ASCII character you had in \(\mathrm{CH} \%\). CHR FP will also work in immediate or program mode.
In the DOS 3.2 and 3.3 manuals, RWTS is described as a machine language subroutine available to "machine language programmers". The following two routines allow a BASIC programmer to use RWTS to read, write or format a diskette from Integer or Applesoft Basic:

 358－E3 585889490101 $3 C 0-1836020$

To use the Integer Basic machine language interface，you need only to：
（1）BLOAD RWTS INT，A754
（2）TRK＝track number between 0 and 34
(3) $\mathrm{SEC}=$ sector number between 0 and 12 (or 15 for DOS 3.3)
(4) CMD=1 (for read), and
(5) CALL 754

RWTS INT will assume you are using the same slot (SL) and drive (DR). If you care to change them, assign SL and DR legal values before calling RWTS INT. If you do not assign BUF a value for the RAM address of where you want the sector data to go, then RWTS INT will assign you an internal buffer in high RAM and put your sector data there and leave you the address in BUF. Any errors on reading, writing or formatting will be returned in ERR. To use the Applesoft version, postfix all the variable names with \% (percent). Now you can build your own DISK ZAP!

## SAMPLE INTEGER BASIC PROGRAM

```
10 INPUT "SLOT=",SL optional
20 INPUT "DRIVE=", DR optional
30 INPUT "TRACK=", TRK
40 INPUT "SECTOR=", SEC
50 INPUT "COMMAND(1=READ, 2=WRITE)=", CMD
60 INPUT "BUFFER=", BUF optional
70 CALL }75
Now BUF=address of 256 bytes read in (if CMD=1) from
SL, DR and TRK, SEC. If Err= 0 now, then no errors.
```

## IMPROVE Your Data Entry!

 With ABT Apple • Peripherals KeyPad ${ }^{\text {TM }}$ Used for entering numeric data, it is essential to business applications. It features an accountants keyboard layout and permits a relaxed arm position. BarWand ${ }^{\text {TM }}$ Compatible with U.P.C., Paperbyte*, LabelCode and others. It sells Point-of-Sale inventory systems, but is also useful in libraries, factories and for security.

SoftKey ${ }^{\text {TM }}$ A great programmer's aid, this features single key string entry and also customized key functions.

ADVANCED BUSINESS TECHNOLOGY, INC.

## Selectric ${ }^{\circledR}$ Interface System

E ASILY interfaced to any IBM Selectric I, II, or III. TOP spinning your wheels. Letter quality at an affordable price.

ONNECTS via Parallel or RS-232, accommodates varied handshaking.

NLY $\$ 575$ to $\$ 599$. Dealer inquiries invited. $\mathbf{N}_{\text {EW }}$ design provides added features.

26 Trumbull Street, New Haven, CT 06511 (203) 562-4979

# SYNERGISTIC SOFT WARE <br> puesents <br> GREAT APVENTURES 

Great adventure games utilizing the Apple's graphic capabilities.

DUNGEON CAMPAIGN
Explore the intricate complexities of a dungeon whose four levels are interconnected by stairways and pits. The dungeon is populated by numerous dragons, spectres, serpents, necromancers, dwarfs, elves, and an incredible variety of monsters. The inhabitant's varying powers and methods of attack will keep you guessing as your party searches the labyrinth for treasure and an assortment of useful magical devices. Try to collect your fortune and escaps the dungeon before your party is destroyed.
Requires 32K APPLE and a color display. Cassette version is $\$ 15.00$; Disk version is $\$ 17.50$. Integer or Applesoft.

## WILDERNESS CAMPAIGN

A surface apventure of even greater variety in which you move across the HIRES map of Draconia exploring ancient ruins, tombs, temples, and castles. Equipment and weapons can be purchased in village markets. Proper equipment will enable you to survive the numerous obstacles and hazards such as crevasses, quicksand, volcanos, avalanches, and hostile inhabitants. As you progress, you will gather enough men, weapons, and magical assistance to challenge the Great Necromancer's fortress itself.
Requires 48 K . Cassette version is $\$ 17.50$; Disk version is $\$ 20.00$. Integer or Applesoft.
Get both Apventures on 1 disk for $\$ 32.50$.

## ODYSSEY: THE COMPLEAT APVENTURE

Odyssey is the ultimate adventure game for the Apple. Explore desolate islands of the dread Sargalo Sea. Learn how to enter the deserted castles, tombs, ruins, and other buildings in search of their treasures. Use your gold to buy weapons and supplies you need for your quest. With enough gold, you can buy a ship and set sail. Face pirates, monsters, storms, demon haunted dungeons, bandits, warlocks, sea serpents, and hundreds of other hazards before you try for the ultimate prize, the High One's vacant throne.
Odyssey utilizes the full capabilities of the Apple with its 3 interlocking programs; detailed and colorful high-res maps, sound effects, and varied animation effects.
Requires 48 K and disk. Integer only, $\$ 30.00$

## DOOM CAVERN

Doom Cavern is a high-resolution graphics version of the classic "Dungeon and Dragons" type games. Set up the persona (strength, intelligence, charisma, etc.) of your players with dice rolls, then venture forth into the dungeons of Hammardoom Castle. With perserverance, some luck, and reasoning, you can win treasures and survive to explore the dungeon.

## SORCERER'S CHALLENGE

A high-res duel for supremacy between two mighty sorcerers using all their devastating spells. Strategic and tactical planning are required to outwit and defeat your opponent.
Both games available on 1 disk. Requires 48 K , Integer only, $\$ 20.00$.

The high-resolution graphics and text for these games were done using our graphics utilities, HIGHER GRAPHICS II and HIGHER TEXT. Add high-resolution effects to your own programs. Each program available on disk in Integer and Applesoft. Each program $\$ 35.00$.

# APPLESOFT PROGRAM LISTING FORMATTER 

by Robert C. Clardy

The Applesoft Program List Formatter originally appeared in the May 1980 issue of CALL APPLE and was written by Mark Capella. A simple but clever program, it formats listings of Applesoft programs for improved readability and logical comprehension. The program was added to, modified, crunched, and played with by a number of A.P.P.L.E. programmers*, but Mark's original concept is still its major feature. Briefly, the original program performed the following functions:

1) Global indenting of FORNEXT statements.
2) Local indenting of IF-THEN statements.
3) Single statements are put on single lines.
4) 'LET' is added before assignment statements.
5) Successive REM statements are grouped together.
6) Titles and dates are allowed.
7) List to screen or printer. Functions that were added include:
8) Stop list with continue or abort option.
9) Paging of printout with title, user name, date, and page number at the top of each.
10) Print statements, REMs, and DATA statements that go beyond one line do not break in the middle of a word..
11) Optional indent capability (to allow binding of output).
12) Optional extra line skips between statements or lines (for markups).
13) Lines, statements, and bytes are counted and displayed on the screen.
14) Start/stop list at any line number.
15) Return to original program when finished.
16) Column print width for hard copy.
*Jim Morrissett, Robert C. Clardy, Chris Anson, and Val Golding

Your APPLE computer becomes your eyes and ears as you enter a spooky old mansion in search of treasure. You are in complete control as you open cabinets, smash walls etc. Danger is ever present as you find your co-adventurers being murdered one by one. Can you find the killer before the killer finds you?

- OVER A HUNDRED HI-RES PICTURES
- YOUR GAME MAY BE SAVED FOR LATER CONTINUANCE
- RUNS ON BOTH 48K APPLE II AND APPLE II PLUS

Hi-Res Adventure * 1 is available now at your local computer store and requires a disk drive. To order directly send $\$ 24.95$ to:
On-Line Sytems
36575 Mudge Ranch Road
Coarsegold, CA 93614
209-683-6858
VISA, MST CHG, COD, CHECK ACCEPTED
Look for Hi-Res Football coming soon

To use the Listing Formatter, you must enter and save the two programs listed. MAKE FP LIST, when run, will create an EXEC file called FP LIST. This file is used to start the whole process. The user simply loads his Applesoft program and types EXEC FP LIST. FP LIST hides and protects your existing program, then loads and runs the PROGRAM LISTING FORMATTER. The user will be prompted by the FORMATTER for his choice of the options listed above. The FORMATTER then PEEKs at the program to be listed one byte at a time, interpreting each and producing its logically formatted listing.
When this style of listing is first seen, it looks peculiar and may take some getting used to. After some use, however, the visual grouping of statements within FOR-NEXT loops and after IF-THEN statements makes for much readier logical comprehension. PRINT, REM and DATA statements are easier to read, without annoying splits between words at the end of each line. Each new statement is on a new line,
allowing a quick grasp of all statements in each line. Assignments are easier to spot. The program even highlights some programming errors such as extra or missing NEXT statements. (Try some; they stand out vividly.) (overall, program compreshension, debugging, and readability are greatly enhanced.
Note that in specifiying printer column width, this value may be exceeded by the number of characters in a given Applesoft token, less one. This is due to the effect of the Applesoft parsing routine. For example, if you have entered 64 as the maximum number of characters per line, and the command "RETURN" started on the 63 rd character position, then that line would be 70 characters long. Accordingly, allowances should be made.
The user should be aware of two features. First, line 2 contains the variable PL\% (page length). This may need to be varied to accomodate some printers/paper size. Secondly, when starting a list
in the middle of a lengthy program, there is a moderate delay while the program steps byte-by-byte up to the beginning line before starting to list. Don't hit RESET, it will get there shortly. Key variables for subsequent modifiers are:

| LN\% | li |
| :---: | :---: |
| MG\% | = margin indent |
| IN | $\begin{aligned} & =\text { indent for FOR-NEXT } \\ & \text { loops } \end{aligned}$ |
| TIN | = indent for IF-THENs |
| LC\% | = current line count |
| PL\% | = page length |
| BY | = byte value |
| PB | = byte pointer |
| NB | = number of bytes left |
| N1 | $=$ total number of bytes |
| LP | $\begin{aligned} & =\text { characters printed this } \\ & \text { line } \end{aligned}$ |
| LL\% | $=$ line length |
| PR\% | $=\begin{aligned} & \text { printer slot or call } \\ & \text { number }\end{aligned}$ |
| PN\% | = page number |
| RF | = REM flag |
| QF | = Quote flag |
| SRF | = single REM flag |

(continued on page 27)

## THE WHAARI AND THE PRRINCESS HI-RES ADVENTURE \#2

Only ON-LINE SYSTEMS could deliver a HI-RES ADVENTURE game on such an epic scale. In this adventure you find you must do battle against an evil wizard in order to save the life of the princess. To find the wizard and his castle you must first cross deserts, oceans, mountains, travel to an island and encounter many strange beasts. You will be forced to learn magic, navigate at sea and dig for treasure. This game should provide months of adventure.

- HUNDREDS OF HI-RES PICTURES (looks great on b/w and color televisions)
- FULL 21-COLOR!! HI-RES GRAPHICS (each room a work of art)
- YOUR GAME MAY BE SAVED FOR LATER CONTINUANCE
- RUNS ON BOTH 48K APPLE II AND APPLE II PLUS
- BY FAR THE MOST AMBITIOUS GRAPHIC GAME EVER WRITTEN FOR THE APPLE!!

Hi-Res Adventure * 2 is available now at your local computer store and requires a disk drive. To order directly send $\$ 32.95 \mathrm{t}$ :

## The Text Solution for APPLE ${ }^{(1)}$

## Now APPLE II ${ }^{\circledR}$ Owners Can Solve Text Problems With VIDEOTERM 80 Column by 24 Line Video Display Utilizing 7 X 9 Dot Character Matrix

VIDEOTERM, MANUAL, SWITCHPLATE

$7 \times 12$ MATRIX 18X80 OPTIONAL

7X9 MATRIX
24X80 STANDARD
Firmware

Perhaps the most annoying shortcoming of the Apple $\|^{\text {W }}$ is its limitation of displaying only 40 columns by 24 lines of text, all in uppercase. At last, Apple $11^{-}$owners have a reliable, trouble-free answer to their text display problem. VIDEOTERM generates a full 80 columns by 24 lines of text, in upper and lower case. Twice the number of characters as the standard Apple $\|^{-}$display. And by utilizing a 7 by 9 character matrix, lower case letters have true descenders. But this is only the start.

## VIDEOTERM

VIDEOTERM lists BASIC programs, both Integer and Applesoft, using the entire 80 columns. Without splitting keywords. Full editing capabilities are offered using the ESCape key sequences for cursor movement. With provision for stop/start text scrolling utilizing the standard Control-S entry. And simultaneous on-screen display of text being printed
Installation of VIDEOTERM in slot 3 provides Pascal immediate control of the display since Pascal recognizes the board as a standard video display terminal and treats it as such. No changes are needed to Pascal's MISC.INFO or GOTOXY files, although customization directions are provided All cursor control characters are identical to standard Pascal defaults. And customized firmware for the Pascal system is available
The new Microsoft Softcard ${ }^{\text {- }}$ is supported. So is the popular D. C. Hayes Micromodem II* utilizing customized PROM firmware available from VIDEX. The powerful EasyWriter* Professional Word Processing System and other word processors are now compatible with VIDEOTERM. Or use the Mountain Hardware ROMWriter* (or other PROM programmer) to generate your own custom character sets. Naturally. VIDEOTERM conforms to all Apple OEM guidelines, assurance that you will have no conflicts with current or future Apple ll* expansion boards.
Advanced VIDEOTERM's on-board asynchronous crystal clock ensures flicker-free character display. Only Hardwar the size of Mascallang ill ensuring cool, reliable operation. All iCs are fully socketed for easy maintenance. Add to that 2 K of Problems are designed out, not in.
The entire display may be altered to inverse video, displaying black characters on a white field PROMs containing alternate character sets and graphic symbols are available from Videx. A switchplate option allows you to use the same video monitor for either the VIDEOTERM or the
standard Apple II. display, instantly changing displays by flipping a single toggle switch. The standard Apple $\|^{\circ}$ display, instantly changing displays by flipping a single toggle switch. The toggle switch is readily accessible. And the Videx KEYBOARD ENHANCER can be installed, allow ing upper and lower case character entry directly from your Apple II* keyboard.
1 K of on-board ROM firmware controls all operation of the VIDEOTERM. No machine language patches are needed for normal VIDEOTERM use

Firmware Version 2.0
Characters $\quad 7 \times 9$ matrix
Options $\quad 7 \times 12$ matrix option;
Alternate user definable
Inverse video option.
$24 \times 80$ (full descenders) $18 \times 80(7 \times 12$ matrix with full descenders)

Want to know more? Contact your local Apple dealer today for a demonstration. VIDEOTERM is available through your local dealer or direct from Videx in Corvallis, Oregon. Or send for the VIDEOTERM Owners Reference Manual and deduct the amount if you decide to purchase. Upgrade your Apple $I^{\circ}$. to full termina capabilities for half the cost of a terminal. VIDEOTERM. At last.

## KEYBOARD ENHANCER

Upper and Lower Case Character Entry Direct from Your Apple $1{ }^{\circledR}$ Keyboard

The Apple $1^{-}$has a simple, reliable keyboard Unfortunately, you can only enter upper case text directly from the keyboard. Now. Videx introduces a powerful KEYBOARD ENHANCER to correct this minor annoyance.

Your Apple if suddenly performs as if it has an ordinary typewriter keyboard. Three entry modes are now keyboard selectable. The original keyboard entry mode is still fully functional; adding the type writer mode with upper and lower case entry writer mode also in both of the last modes, the shift keys will perform exactly as they do on any type keys will perform exactly as they do on any type

But that's not all. In the normal Apple II mode KEYBOARD ENHANCER allows you to enter 9 new characters directly from your keyboard utilizing the A new Power key cap is included with two built A new for instant positive identification of which LEDs for instant positive identification of which
mode you are in. Accidental RESETs are prevented by requiring that the Control key be depressed with
the Reset key to activate the RESET operation. The easy installation and simple. rugged hardware design mean many years of trouble.free use

You may utilize the KEYBOARD ENHANCER with Videx's VIDEOTERM for full 80 column by 24 line terminal quality display (usable with both BASICs and Pascal). Or use it with Dan Paymar's Lower Case Adaptor for display of upper and lower case charac ters on the standard 40 column wide Apple $\|^{\circ}$ video display. Or use it alone to simplify your word proces sing text entry.

KEYBOARD ENHANCER is recommended for use with Apple II• Revision Zero and One keyboards (those lacking the Control-Reset feature). The kit includes 5 ICs mounted on a PC board. the neces sary mounting screws (no drilling necessary). a jumper cable. Power key cap with LEDs and cable assembly. and instructions for quick installation and
trouble free use. Visit your local Apple dealer today trouble free use. Visit your local Apple dealer today writer keyboard performance with the KEYBOARD ENHANCER.

# ON-LINE SYSTEMS PRESENTS <br> <br> HI-RES FOOTBALL 

 <br> <br> HI-RES FOOTBALL}

By JaY SULLIVAN And KEN WILLIANS

This is the football game you always thought your Apple was capable of, but no one seemed able to deliver!
Of course, Hi-Res Football portrays the field and players in fult animated Hi-Res Graphics, but do not confuse it with football games of the arcade variety. This game captures the strategy aspects of an actual football gamel) As coach you: call the plays, try to use the clock to your advantage moke those critical fourth down decisions, battle for field position and more! On the playfield, as quarterback, you must be able to read the defense while constantly eyeing your receiver and at the same time trying to "Fake Out" the defense, It is impossible to describe here the feelings one gets when you successtully complete that two minute goal-to-goal drill or on defense when you sack the quarterback on third and goal. Please visit a computer store in your area to request a demonstration. Thank you.
Runs on any 48 K Apple II or II Plus, DOS 3.2 or 3.3. Available now for $\$ 39.95$ on disk from your local computer store or you may order directly from:

ON-LINE SYSTEMS

# LOCATIONS OF INTEREST TO PASCAL \& 6502 USERS 

by Randy Hyde<br>Original Apple Core

Pascal is an island all to itself. None of the existing BASIC, FORTH, or 6502 assembly language programs may be used with UCSD Pascal. Pascal does support a fairly powerful, though difficult to use,

6502 assembler. This assembler is great for those time critical routines. Although Pascal runs at an average of 2-10 times faster than BASIC, this often is not good enough for some applications (fast
animation anyone?). In any case, the experienced programmer will probably find some reason for using 6502 assembly language programs in conjunction with his Pascal programs. The new user to the Pascal system's assembler will really feel cut off, because there is no provision for I/O! Actually, there is a provision for I/O, but much like the early Apple II owners, the documentation for the Pascal "monitor" (known as the "BIOS") has not yet been made generally available. There is a very good reason for this, the Pascal system has not yet been fully defined and as a result addresses may change in later systems. Since a change of only one byte would render a piece of software totally useless, Apple has elected not to make the information available until the Pascal System becomes a little more stable.

Fine, Apple has good intentions. But what about those of us who don't care? What do we do in the mean time? Well, the listed addresses may be of help to such persons:

The Most Powerful Disk-Based Macro Assembler/Text Editor Available at ANY Price

```
Now includes the Simplified Text Processor (STP)
    For 32K PET, disk 48K APPLE II
    3.0 or 4.0 ROMS or - OR - or APPLE II +
    8032 (specify) and DISK II
MAEFEATURES
- Control Files for Assembling Multiple named source files
    from disk
- Sorted Symbol table - Up to 31 chars./label
- 27 Commands, 26 Pseudo-ops, 39 Error Codes
- Macros, Conditional Assembly, and a new feature we developed
    called Interactive Assembly
- Relocatable Object Code
- String search and replace, move, copy, automatic line
    numbering, etc.
STP FEATURES
-17 text processing macros
- Right and left justification
- Variable page lengths and widths
- Document size limited only by disk capacity
- Software lower case provision for APPLE |l without lower
    case modification
ALSO INCLUDED
- Relocating Loader 
- Sweet 16 macro library for APPL
- Machine Language macro library 
- Sample files for Assembly and text processin
- Sepa

CONSOLE READ: \$FF00 - Reads a character from the keyboard type-ahead buffer. Character is returned in the accumulator.
CONSOLE WRITE: \$FF03 - Writes a character to the 80column screen. Character is passed in the accumulator.
CONSOLE INIT: \$FF06 - Initializes screen variables for input/output. Pointer to SYSCOM must be at $\mathrm{SP}+3$, SP+4 and a pointer to break vector must be at $\mathrm{SP}+5, \mathrm{SP}+6$. (see memory map)
PRINTER WRITE: \$FF09 - outputs character in accumulator to the printer.
PRINTER INIT: \$FF03 - Initializes the printer.
DISK WRITE: $\quad$ \$FFOF - Writes data to the disk. Block number at $\mathrm{SP}+3, \mathrm{SP}+4$. Byte count at $\mathrm{SP}+5, \mathrm{SP}+6$. Data area address at $\mathrm{SP}+7, \mathrm{SP}+8$. Drive number at $\mathrm{SP}+9, \mathrm{SP}+10$.
DISK READ: \$FF12 - Same parameters as disk write.
DISK INIT: $\quad \$ F F 15$ - Inits all disk drives.
REMOTE READ: \$FF18 - Reads a character from the serial card in slot \#2.
REMOTE WRITE: \$FF1B - Writes data to the serial card in slot \#2.
REMOTE INIT: \$FF1E - Initializes serial card in slot \#2.

# CREATIVITY LIFE SOFTWARE REVIEW 

by David B. Garson

Program: The Creativity Life Dynamic Package
Author: Avant-Garde Creations P.O. Box 30161 Eugene, Oregon 97403
Distributor: Same
Purpose: To expand one's knowledge of creativity
Language: Applesoft (ROM), 48K, Disk II
Price: \$19.95, Disk and Manual

## RATINGS

Speed: 65
Ease of Use: 75
Documentation: 80
Error Comments: 60
Screen Display: 85
Reliảbility: 70
Technical Program Level: 60
Average: 71
This piece of software is truly different than most. The programs are all right, but the purpose of them is quite different. Most software serves a purpose of either pleasure (games), or usefulness (business, etc.). This package tries to enlighten your knowledge of creativity. This in itself is not bad, but the manner in which the author presents it is. The author talks at great lengths about creativity (in both the programs and the manual), giving you the impression that with the aid of this program your 'creative potential' may be expanded. Pretty heavy stuff for a program - almost like a religion? The author's point is well taken and the program does do this, but his style in presenting these ideas is too aggressive.
Thus, instead of presenting a program designed to aid in the designing of Hi-res displays, the
author's purpose is to expand our understanding and knowledge of creativity. This he does well and must be kept in mind when reading the rest of this review. Now on to the actual review of the software package. .

The first noticeable problem with the program is that nowhere in the manual does it describe how to start the program. The manual simply begins describing what the program does. For experienced users this is no problem, but for a newcomer it can cause real headaches.

The manual is broken down into four sections, one for each of the major programs (I. Instant Graphics, II. Instant People, III. Music, and IV. Poem Writing) that appear on the diskette. The manual itself is 88 pages of first rate printing, but even with this length I still did not have a good feel for the programs. The author's style is very breezy and light-hearted as well as having little structure to the description and use of each of the programs. The most valuable pieces of documentation that 1 found to be of help, were two $51 / 2^{\prime \prime}$ by $81 / 2^{\prime \prime}$ light cardboard sheets that give a good overview of the commands for each of the programs.

The first program in the package is Instant Graphics. This piece of software is a Hi-res drawing program that allows the user to make many interesting designs as well as pictures. The user is guided through the program with the aid of the Apple's speaker. I found this technique very easy to determine just what key to press next. The program allows for a wide range of
different shapes (circles, triangles, rectangles, etc.) to be drawn anywhere on the screen in a variety of sizes and colors. All sorts of different backgrounds can be created from sliding diagonal walls, or a horizontal sliding wall, to random dots on the screen.

The program demostrates many techniques to generate all sorts of unique pictures and designs (which are printed in the manual). The user has the ability to draw with the paddles at any time, plus the user can draw things like random lines or fireworks, to name just a couple. This program is an enjoyable one and will be appreciated by anyone with a fancy for Hi-res graphics.

The second program in the package is much like the first, but has a cute twist. Instant People allows you to draw Hi-res figures (people) on the screen instead of just miscellaneous designs. One can draw a man, woman, boy, or girl with a variety of different expressions as well as having control over the positions of the arms and legs.

One interesting note about both of these programs is the ability to save you work. Of course it has the standard method of saving the Hi res screen, which can be loaded in and looked at any time, but it also has a save command that will save the drawing as you draw it. Thus when you retrieve that drawing it will come back just as you drew it. This capability also allows for animation (very limited) which is described in the manual, but is nothing when compared to any of the animiation packages that are on the market today.

Once you have created a scene with the appropriate people you then can design the background of your choice. This feature can make for some very interesting displays. (After struggling for a while, this reviewer was able to make a man and a woman look at a mountain scene and turn their heads.)

The next two programs contained nothing new or exciting. The first was a music generation program, and as far as I am concerned there are much better ones in the public domain. The last program is called Poem Writing, but in my opinion was nothing more than a Mạ-Libs program.
(continued on page 39)

# WE CAN TAKE YOU FROM WATERLOO TO THE SUPER BOWL. (By way of the North Atlantic.) 

In the few short months since we introduced Computer Bismarck ${ }^{\mathrm{m}}$, we've transported over 2500 adventurous minds to the North Atlantic there to recreate the historic battle between the awesome German warship and the British Home Fleet. The startling realism and excitement of that experience have prompted many well-seasoned travelers to proclaim it "... unique among computer games and board games alike.*" One enthusiast had this to say: "The wealth of detail...is hardly short of fantastic. Only real war rooms...in the Pentagon have ever before been able to simulate a battle in this manner.**" Now we offer two more strategy games to embark you on new flights of the imagination.

## COMPUTERNAPOLEONICS ${ }^{\text {m }}$

takes you to the battlefields of Waterloo on the fateful day of June 18, 1815. Here, the greatest battle ever fought is about to begin, awaiting only your commands to set the amassed armies in motion.

You and your friend choose your role either as the military genius, Napoleon, or as the Duke of Wellington, the iron-willed leader of the Anglo-Allied forces. The video screen displays the map of the Belgian countryside with the artillery, infantry, and cavalry units under your respective commands.
AS NAPOLEON, you must utilize your superior combat strength and numbers to deal Wellington a quick and decisive defeat before his Prussian ally can supply reinforcements. Speed is of the essence. But any tactical blunders in military deployment will result in a repeat of history - Napoleon's ignominious defeat.
AS THE DUKE OF WELLINGTON, you must not only survive the onslaught of the French artillery, cuirassiers, and the dreaded Imperial Guard, you must also inflict sufficient damage to Napoleon's forces to prevent his relentless northward march of conquest.
THE COMPUTER, in our solitaire scenario, plays Wellington while you play Napoleon. Two levels of play are provided by making the entry of Prussian reinforcements variable. This makes the need for French military decisiveness and devastating execution even more critical.

## FOR TH்E NOVICE AND THE ADVANCED.

Computer Napoleonics has all the advantages of your basic, traditional wargame -meticulous detail, realism, and playability. Plus one. Because the computer keeps track of all the rules, neither player can make an illegal move. This makes learning it a cinch (mastery is quite another matter), and it will convert the novice wargamer into a fanatic in no time.

The advanced wargamer will find the computer a worthy opponent indeed, and the two levels of play in the solitaire version will challenge the most experienced of strategists.

## COMPUTER QUARTERBACK ${ }^{\text {m }}$ <br> propels you onto the playing field of the Super

 Bowl. From its multiple offensive and defensive plays and its real-time playing conditions to the animated video display of the gridiron and the halftime statistics, no strategy football game has ever been more complete in detail or as exciting in realism. Three versions are offered: Semi-Pro, Pro, and Computer-as-Opponent.SEMI-PRO presents you with a choice of 18 offenses and 14 defenses. Here, you will begin to learn the intricacies of football; the thrill of the perfectly executed two-minute drill; the agony of the fumble, interception, and penalty. On offense, you will learn to read the defense and call audibles as needed.

After you have mastered the Semi-Pro version, it's time to move on to the Big Time...the Pro version!
THE PRO VERSION not only gives you every offense (36) and defense (24 plus doubleteaming capabilities and special alignments) you could ever want, it also gives you the team you want! With 2.7 million computer dollars, you get to draft a team to your style and specifications. Spend more on your quarterback and receivers and your passing game may very well be unstoppable...but your running game may suffer for lack of funds.
THE COMPUTER eliminates all the organizational drudgery of conventional board games. It plays scorekeeper, referee, umpire, and linesman. As timekeeper, it makes you play in realtime. Take longer than 30 seconds to hike the ball and five yards will be marched off against you for delay-of-game.
"THE ROBOTS" is the team most ably coached by your friendly computer. It's ready to play any time you are. It even "learns" your tendencies and patterns through time, and it will make the necessary tactical adjustments. It plays so well you must be in top form to stand a chance against it.

All you need to start on these mind journeys is an Apple II with Applesoft ROM card, 48 K memory, and a mini-floppy disc drive. For $\$ 59.95$, Computer Napoleonics comes with the game program minidisc, two mapboard cards, a rule book, and two player-aid charts. Computer Quarterback, for $\$ 39.95$, gives you the game disc, a rule book, and four play diagram charts.

Credit card holders, call 800.648-5600 (toll free) and charge your order to your VISA or MASTERCHARGE. In Nevada, call 800-992-5710. For Computer Quarterback, ask for Operator 178; for Computer Napoleonics, Operator 179.

While you're at it, you can also get our other games: - Computer Bismarck for your Apple: $\$ 59.95$ (Operator 180) Computer Bismarck, TRS-80 48K Disc: \$59.95; 32K Cassette: $\$ 49.95$ - Computer Ambush (a tactical simulation of man-to-man combat in World War II) for your Apple: $\$ 59.95$ (Operator 181)

To order by mail, send your check to Strategic Simulations Inc., Dept. CA, 450 San Antonio Road, Suite 62, Palo Alto, CA 94306. Our 14 -day money back guarantee assures your satisfaction.

[^2]
# A MACHINE LANGUAGE ADDRESS CALCULATOR 

by Russ Lavallee

Utilities should be written in assembly language, if at all possible, so that they can be made easily coresident with the BASIC program for which they will be used. Utilities written in BASIC can work, but they can be cumbersome to use. A convenient location for a machine language utility is in the normally unused page $\$ 300$ - only up to \$3CF, because DOS "jumps" begin at \$3D0. Here it does not interfere with or steal memory from the BASIC program and variable areas.
This routine extends the power of Applesoft immediate or calculator mode (]) by allowing Integer hex decimal constants as input into the expression to be evaluated, along with decimal constants, variables, and all Applesoft arithmetic operators. The result will be printed 3 ways:

1. The Integer portion in hex.
2. The Integer portion in unsigned decimal.
3. The full precision result in signed floating point decimal.
More than just a converter, this makes Applesoft a powerful $\mathrm{dec} / \mathrm{hex}$ calculator. Although it is intended primarily for address calculations, the printing of the FL-PT result serves two purposes:
4. The Integer portion will display negative decimal addresses if 65536 is subtracted at the end of the expression.
5. By comparision with the decimal Integer result, a check of Applesoft truncation and round-up effects can be made to see if the Integer result is the desired one (e.g., try 1/0.1).

On the slightly negative side, besides the Integer limitation on hex input and output, the expression must not exceed 3 lines (about 120 characters), only one expression per call will be evaluated, and it cannot be used in a program. Although the routine could be written without these limitations, no need was foreseen, and the extra code would prevent the page $\$ 300$ placement. Thus I will invoke the standard cop-out, "The exercise is left to the reader. . ...".
Before the first use, the routine must be run once to set up the " $\&$ " jump at locations \$3F5,6,7 (*300G from the monitor, or CALL 768 from BASIC). Then in Applesoft, "]< expression > < return >" will print, "\$hhhh D=iiiii (FP=iiiii.fff)". Hex numbers in the expression must be preceded by "\$" and a value $>\$$ FFFF will generate an error message for both input and output. A negative decimal address can be displayed by subtracting 65536 at the end of the expression, ]\&FF6965536 <return > will print -151 , the well known monitor entry. Conversely, the hex equivalent of a negative decimal address is obtained simply by entering it. ]\&-151< return> will print \$FF69. If 65536 is to be used often, a variable can be assigned to it, (]Z=65536), and then $] \& \$ F F 69-Z<$ return $>$ will print -151 .
If you don't have an assembler and your page $\$ 300$ is occupied, hand relocation to work in any page requires only changing location 301, 358, 37C, 386, 390, 39D, $3 B D$ from value 03 to the highorder byte of the new page. To work at $\$ 5000$, use 50 for example.

Although the listing is for Applesoft in ROM, the routine works just as well for the RAM Applesoft if the locations in parenthesis in the "EQU" statements are substituted.
The basic idea behind the routine is very simple - use the ampersand to sneak in and modify the expression text to change "\$HEX-ASC" to "DEC-ASC" before sneaking out and letting Applesoft finish its job. However, the expected elegance was somewhat soured by the amount of patching needed to get the FP-BASIC routines to work with the monitor routines (eg., the different signs for ASC characters). Because of Applesoft pre-processing, when the " $\&$ " jumps to the routine, the text has been tokenized and sits in page $\$ 200$. The "MOVELP" routine scans it and moves it to the second half of the page ( $\$ 200$ ) until it encounters the end-of-line token ( 00 ), or the '"\$" character. The " $\$$ " detection causes a branch to "GETHEX" where the subsequent hex-asc characters will be modified by turning on their sign bit. Then "GOTHEX" will point to the first hex char with the $y$-reg and call "GETNUM" in the monitor to read the hex-asc and convert it to binary in the A2L/H locations. "CVDEC" then diverts any printing to the "MOVDEC" routine and calls "LINPRT" to print the dec-asc equivalent of the binary number. "MOVDEC" will append decimal text to the previously moved expression text in the second half of $\$ 200$. The "MOVDEC" hook is removed by "SETVID" and text scanning continues to "MOVELP" just after the "hex-asc" number that has just been processed.
When the end-of-line token is detected, the "end" routine marks the fact in the second buffer, points to the beginning of the second buffer which now contains only decimal values, and calls "FRMNUM" to evaluate the expression and place the result in the FL-PT acc. "GETADR" converts the FL-PT acc to binary integer in ACL.H which is printed in hex by "PRNTAX", and in unsigned decimal by "LINPRT". The modified text buffer is pointed to again, and "FRMNUM" called
(continued on page 32)

DESIGNED FOR THE APPLE $\|^{\circledR}$

## 80 X 24 DISPLAY CARD

- Permits selection of 80 column or Apple 40 column/graphics on a single monitor via keyboard or program control
- Available character fonts include $7 \times 9,5 \times 7$ or EROM
- Full keyboard editing
- 127 characters with upper/lower case
- Chrystal controlled clock for excellent character quality
- Keyboard Shift-Lock identified by blinking cursor. Un-Shifted keyboard identified by non-blinking cursor
- Light-pen connector and light pen firmware support
- 2K firmware on card
- Lowest power requirement of any $80 \times 24$ card on the marke
- User definable character sets with the optional EROM Adaptor and a 2716 or 2732 (255 characters!) EROM
- Individually selectable inverse or normal characters
- Real time $1 / 60$ second nonmaskable interrupt clock can be software enabled to permit timing of programs in background mode
- Tab
- $80 \times 24$ display memory is contained on card
- $50 / 60 \mathrm{~Hz}$ operation
- 7 keyboard function keys with pressure sensitive adhesive label provides HOME, HOME \& CLEAR, CLEAR TO END OF LINE, CLEAR TO END OF SCREEN, CATALOG, LOAD, and RUN
- Works with Apple II, Apple II Plus, Apple Pascal, Z-80 Softcard ${ }^{\circledR}$, and D.C. Hayes Micromodem TM
- Compatible with all Apple II peripheral cards
- Fast scroll - both scroll up and scroll down
- READ screen capability
- XY cursor positioning via GOTO X, Y command
- Blank screen command to suppress video

List Prices: $5 \times 7$ or $7 \times 9 \$ 395.00$ Manual only \$ 15.00
See your Apple Dealer for a demonstration of the FULL-VIEW 80. Or contact Bit 3 for more information.

# SOME NOTES ABOUT THE UCSD ASSEMBLER 

by Ron Haines<br>Apple Users Group, New South Wales

One of the criticisms that has been aimed at the Apple Pascal System is that the documentation is often far too terse. This is particularly so in regard to the assembler, which is quite sophisticated, yet only briefly described in the manual.

In this note I'll attempt to explain two aspects of the assembler which I initially found confusing. These are the use of local labels and the addressing of variables declared as public.

## 1. Local Labels.

In the Apple Pascal manual [1] the use of local labels is mentioned but no explanation of what they are or how to use them is given. Quite by accident I stumbled across a reference to local labels in the manual for the assembler of a large mainframe system. This referred me to Knuth's 'Art of Computer Programming' [2]. It seems that the allowed usage of local labels in the UCSD system is more restricted than in Knuth's assembler, however the motivation for using them is the same. They provide an easy way to address locations that are a short distance away from an instruction. In addition they may be multiply defined, with only the most recent definition being usable.

Local labels consist of a ' $\$$ ' followed by up to 8 digits. One
should be cautious however, since the local label stack can only hold 21 labels. Local labels cannot be used in an .EQU pseudo-op and so can only be defined by placing them in the label field before a nmemonic. Because they can be redefined, local labels can be used in macros where a normal label couldn't be used, since repeated use of the macro would multiply define a regular label.

An example of local label usage:

| \$01 | LDA 00 |
| :---: | :---: |
|  | $\cdot$ |
|  | JMP \$01 |
| \$01 | LDA 01 |
|  | BPL \$01 |

The second branch to $\$ 01$ will be to the second definition of $\$ 01$.

Related to local labels is the idea of addressing relative to the location counter. To reference the location counter, use ' $*$ '. Thus a branch that would skip a one byte instruction could be written: BCS *+3. The following two examples are equivalent.

> LDA C000 BPL *-3 LDA C000 BPL \$01
\$01 LDA C000
Note that in the first example the branch was to ${ }^{*}-3$ since the location counter was pointing to the branch
instruction. Thus three bytes had to be subtracted to point to the LDA instruction. It is also permitted to omit the * altogether. Thus BPL *-3 could be written as BPL -3.

## 2. Public Variables.

These are data areas that are shared by the Pascal host program and the assembly language routines. Public variables must be declared in the global variable section of the Pascal host, since only then will they be given absolute addresses which the linker can use. Variables declared at deeper levels of the Pascal program are allocated storage as their associated routines are called, and so cannot be absolutely addressed.

Public variables are identified in the assembly language program by the .PUBLIC pseudo-op. The variable name may then be used as though it were a label pointing to the first byte of the variable. Thus if ' $A$ ' was declared as an integer in the Pascal host then

## .PUBLIC A

.

## LDA A

would load the accumulator with the low order byte of $A$, while

## LDA A+1

would fetch the high order byte of A. Arrays are treated in the same way, with the array name becoming a symbolic label for the starting location of the array in memory. To access the individual elements of the array the indirect indexed addressing mode of the 6502 is convenient. For instance, to access the third element of an integer array named 'VEC', in the Pascal host program one could use:

```
.PUBLIC VEC
LDA VECLABL
STA ZERO1
LDA VECLABL+1
STA ZERO1+1
LDY \#04
LDA @ZERO1,Y
VECLABL .WORD VEC
```

Dakin5 Corporation, a Colorado software house, is making available to the public 12 utility programs on one 16 sector diskette, utilizing the new Apple DOS 3.3, which provides $23 \%$ more storage.

These menu-driven utilities will facilitate the development of your own microcomputer programs.

All of the Dakin5 Programming Aids 3.3 programs are also compatible with the Corvus Disk Drive system.

This 12 -in-1 set of utility programs accomplishes the following:

The Lister sends BASIC programs to the printer to be listed, utilizing the full line capacity of the printer. Pagination and page headings, including program name and date, are also provided as additional options.

The Line Cross Reference produces a display or a printed listing of all lines referenced by GOTO, THEN, GOSUB, LIST or RUN statements in an Applesoft BASIC program. Crossreferencing of most programs is done in a few seconds. An option allows you to print only the line numbers referenced in GOSUB statements.

The Variable Cross Reference creates a display or a printed listing of all variable names used in an Applesoft BASIC program, showing all line numbers where a given variable name is used.

The Peeker displays or prints either all or selected records from a text file.

The Patcher allows you to display any sector of a given file or program, and then to update any data within that sector. Another option permits you to specify the sector you wish to update such as directory sectors and sectors occupied by DOS.

The Copier copies absolutely ANY type of file or program on a normally formatted diskette from one diskette to another. The name of the program or file is the ONLY information needed.

The Calculator adds, subtracts, multiplies and divides very large numbers using numeric string data. The Calculator subroutine (using twenty place accuracy) is written in Assembler code, and runs much faster than an equivalent BASIC subroutine.

# FLOAT, FLOAT, FLOAT YOUR POINT (F.P. REPRESENTATION) 

by Guy A. Lyle

COPYRIGHT® 1980, Guy A. Lyle ALL RIGHTS RESERVED<br>Reprinted from "The Harvest" Vol. II, No. 3, Nov. 1980<br>Northwest Suburban Apple Users Group

"Why can't I store a number much greater than ten to the 38th power?" "What is 'floating point'?" "How are floating point numbers stored inside the computer?" "What's the difference between floating point and integer numbers?" "When should I use floating point? Integer?"

I have heard these questions numerous times. Their central theme is the mysterious 'floating point' type of value. So, let us take a look into this mystery to see if we cannot answer some of these questions.

## What is Floating Point?

The primary difference between F.P. numbers and integer numbers is that F.P. numbers may have decimal fractions as part of their values, Numbers such as $23,-100,0$, 6 , and 12345 are all integer numbers. F.P. numbers can include such values as 12.1, $-16.5,0.023$, -100 , and 5000.123. These all possess fractional parts to their values. Note that the value -100 was included in both lists. It may be considered a F.P. value whose fractional part is ". 0000 ....". Therefore, any integer value may also be considered to be a F.P. value, if so desired. The reverse is not always true.

## How are they stored differently

Computers store integer and F.P. values differently. Integer variables are stored by the APPLE II's Applesoft Basic in two bytes of memory. The coding techinque
used is known as " 2 's compliment" notation. Values in the range of -32768 through +32767 are legal using this notation. For some reason, Applesoft will not allow the -32768 value, making the lowest value - 32767 . Integer type variables are denoted by a percent sign (\%) following the name of the variable, as in $1 \%$.
Applesoft stores F.P. values in five bytes of memory. The coding technique used is one variation of the floating point notations generally used. The first byte of the value represents what is known as the "exponent" of the value. The remaining four are known as the "mantissa". Very crudely, the coded value represents a number using the following formula:
value $=$ mantissa $* 2 \dagger$ exponent
Remember that the exponentiation is always performed first. I say 'crudely' because there are some rules regarding the storage of the mantissa and the exponent in Applesoft's storage method. Floating point (or 'real') variables háve no percent sign or any other sign following their names.

## The Technical Details

The exponent byte is stored as an unsigned value, from 0 through 255. It is encoded in "excess 128 " notation. That is, the stored exponent is 128 higher than the actual exponent which it represents. Therefore:
actual exponerit $=$ exponent byte 128

This allows the exponent a range of -128 through +127 .

The mantissa is stored to 32 bits (four bytes) of precision. This will allow storage of values up to about 4.2 billion without loss of accuracy. The mantissa is stored as a fraction rather than as an integer value, however. It is assumed that the decimal point is immediately to the left of the leftmost bit. Furthermore, the mantissa is always adjusted so that the leftmost bit is a " 1 ". The legal range of values for the mantissa is ". 1000000000000000 0000000000000000 " through ". 1111 1111111111111111111111111111" in binary. These represent decimal values of " 0.5 " and approximately " 0.9999999 " accordingly.

The process of forcing the leftmost bit of the mantissa to be a " 1 " bit is called "normalization". If the result of any computation is not already normalized, then it must be normalized before future use. This process involves shifting the bits in the mantissa to the left to bring the first non-zero bit into position. In order to compensate for the changing mantissa, the exponent must be decremented by one for each position which the mantissa is shifted left. This serves to preserve the value which the entire F.P. number represents. Conversely, any operation which requires that the bits of the mantissa be shifted to the right also requires that the exponent be incremented by one for each position shifted.

The mantissa must also have at least one bit which represents its sign, positive or negative. Since the leftmost bit of a properly normalized mantissa is always a one, Applesoft hides this bit and in its place a sign bit is provided. A zero bit represents a positive mantissa while a one bit represents a negative mantissa. Therefore the mantissa, in its final form, consists of a sign bit followed by the 31 least significant bits of the mantissa's value. The most significant bit of the mantissa is a "hidden bit" whose value is always " 1 ".

I should add a note here regarding the sign of the F.P. value. It is the sign of the mantissa which determines the sign of the F.P. value. The sign of the exponent
merely determines the magnitude of the F.P. value -21 exponent will always be positive regardless of whether 'exponent' is positive or negative. $2 \mid 3$ is $+8,2 \mid-3$ is $+1 / 8$ or +0.125 . This point has always been one of confusion for students when studying the similar topic of scientific notation.

The following table demonstrates the storage of some common F.P. values. These were produced using a "F.P. VARIABLE PEEKER" program provided at the end of this article.

| value <br> (decimal) | F.P. representation (hex) |
| :---: | :---: |
| 6 | \$83 40000000 |
| 3 | 8240000000 |
| 1.5 | 8140000000 |
| -1.5 | 81 C0 000000 |
| 0.1 | 7E 4C CC CC CD |

Examining the representation for " 6 ", we see an exponent of $\$ 83$, or 131 decimal. The actual exponent is 131-128 or just 3. The mantissa shown is.$x 100000 \ldots$... The ' $x$ ' is the hidden bit, and is always " 1 ". Therefore, the real mantissa is . 1100000 , or 0.75 decimal. The F.P. value represented is therefore:

$$
\begin{gathered}
0.75 * 2 \uparrow 3 \\
=0.75 * 8 \\
=6
\end{gathered}
$$

Note that the representation for " 3 " simply has an exponent one less than that for " 6 ". And the same for " 1.5 ". Their mantissa are identical, only their exponents differ.
The " -1.5 " value demonstrates the setting of the sign bit in the mantissa for the negative value. Note that the only difference between " 1.5 " and " -1.5 " is the setting of this sign bit. This is true for any positive-negative pair. To find the absolute (positive) value of a F.P. number, simply clear its sign bit. (For you Assembly programmers, that is simply an 'AND \#\$7F' with the high mantissa byte).

## F.P. Operations

The full range of normal operations can be performed on floating point values; addition, subtraction, multiplication, and division. Special rules must be used, however. Those readers who
are familiar with the rules of operations when using scientific notation (also known as powers-often notation) have a decided advantage here. The same rules apply.

Multiplication and division are the easiest to work with. There are three steps involved: (1) The "actual" exponents are added (for multiplication) or subtracted (for division). (2) The mantissas are multiplied. (3) The result is then properly normalized. Overflow will result if the actual exponent exceeds 127. Underflow occurs if the exponent is less than -128 . Applesoft generally ignores underflows, turning the result to " 0 ". Incidentally, " 0 " is a special case - all five bytes are $\$ 00$ in representing " 0 ".

Truncation of accuracy is easily seen when looking at multiplication. When two 32 -bit values are mutliplied, the result is a 64-bit value. Only the most significant (left-most) 32 bits of this result are maintained in the final result. The other 32 bits are generally just chopped off. Sometimes a rounding-off algorithm may be applied, although I do not know whether or not Applesoft applies such an algorithm. If there are any non-zero bits in the 32-bit chopped off portion, then loss of accuracy results. The 32 bits of maintained result represent about $91 / 2$ digits of decimal accuracy (1 in 4.295 billion).

Addition and subtraction generally involve a more complex process. Before these operations can take place, both exponents must be made equal. This is generally done by pre-adjusting the mantissa and exponent of the value having the least exponent. For each position the bits of the mantissa are shifted right, the exponent must be increased by one. This process continues until both exponents are equal. At this time the mantissa can be added (or subtracted). At times 32-bit additions can produce 33 -bit results. Some subtractions can produce less then 32 -bit results. In either case, normalization of the final result must take place.

Addition or subtraction of value
with very large differences in magnitude can produce unusual results. This is due to the preadjustment of the least-exponent mantissa prior to the operation. If the difference in the exponents is greater than 31, then the mantissa of the least-exponent number would be complete shifted away, leaving a mantissa of " 0 "! Adding (or subtracting) two such widely different numbers would produce a result equal to the larger number alone.

## F.P. vs Integer

So what's the advantage of F.P. numbers? The primary advantage is the ability to express fractional portions conveniently. There are many things in the world which simply cannot be expressed well as integer values. The nine-digit accuracy of Applesoft's F.P. values also offers more utility to the user, as opposed to the $41 / 2$ digit range of integer values. Many other BASICs only offer six or seven digit accuracy in their F.P. values. This is because they only offer a 3-byte mantissa. One could argue that double-precision (say four or five byte) integer values could have solved this problem, but this could not provide for fractional values nor the large range of exponents available in F.P. values.
F.P. values are not without their problems, however. One major problem is the time which it takes to perform F.P. operations. Much more bit-twiddling is involved in F.P. operations as compared to straight, everyday integer operations. Programs using F.P. operations are significantly slower than those involving integer operations. This is one of the primary reasons that APPLE II Integer Basic programs execute so much more rapidly than Applesoft Basic programs do. This also brings up one of the basic failings of Applesoft Basic - It fails to take advantage of easier and quicker integer value operations. In an expression containing Integer type values and variables, all values are converted first to F.P. values before operations with them are effected! (See Applesoft Reference Manual, page 18, second paragraph from
bottom.) This process of integer-toF.P. conversion adds even more time to evaluating the expression. It is fairly easy to demonstrate, by timing repeated execution loops, that such expressions take longer to evaluate. FOR-NEXT loop execution alone would be significantly increased if the authors had allowed the use of integer-type variables for the control variable. I have used a BASIC which does allow this and the difference can be quite noticable.

The question becomes one of "Why bother with integer-types?". In terms of Applesoft Basic, there are several things which can be stated in favor of integer-types.

Some BASIC functions expect integer-type arguments. When such functions receive F.P. arguments, time must be taken to convert them to integer values, while integer values would be used directly.

I have also made use of the integer-type variable to denote certain types of values within programs. Memory addresses, for example, may all be maintained in integer variables. As such, these represent more of a programmer's aid and do not offer much of any aid to BASIC.

The most significant area of usage for integer variables is in large numeric arrays. A $100 \times 100$ array of F.P. values would require about 50,000 bytes of memory impossible within the APPLE II. If an integer array were used, only about 20,000 bytes of memory would be needed - possible, depending upon the size of the program. This is a savings of $60 \%$ ! The only restriction is that the values to be stored must be representable in integer format: - 32767 through +32767.

It should be pointed out, however, that there is no space savings in using simple (non-array) integer variables. Each numeric simple variable, F.P. or integer, consumes seven bytes of memory. For integer variables, three of the seven bytes are not used.

## FLOATING POINT VARIABLE PROGRAM

A program which shows how
floating point values are stored in the computer's memory has been provided. The user RUNs the program and enters any F.P. value when requested. The program then prints out the hexadecimal representation for that value.

The representation of the value is taken directly from the table which Applesoft keeps of all its simple variables. The variable V is used before any other variables in the program in line 150. This insures that it will be the first entry in the table. Line 160 computes the memory location of the first five bytes which will hold V's value.
The FOR..NEXT loop from line 210 through line 270 scans through these five bytes, PEEKing their values from memory and displaying them on the screen. The subroutine at line 300 is called twice within the loop, printing one hexadecimal digit each time (in line 310). Line 220 computes the high order digit to be printed by the subroutine, line 240 the low order digit. Line 260 simply prints the space between each byte value.

```

## UCSD ASSEMBLER from page 35

'ZERO1' is assumed to be a zero page location defined elsewhere in the program. The '.WORD' pseudo-op is used to reserve space in the codefile for the linker to later insert the address of ' VEC '. The first thing the program does is to move this to zero page, ready for the indirect indexed addressing mode in the 'LDA' instruction. Note that the $Y$ register is loaded with \#04 to access the low order byte of the third element of 'VEC'. Each integer element takes up two bytes. The way Pascal allocates space for variables is described on page 202 of the manual. It is essential to be aware of this information before accessing public variables from assembly language routines. Note also the non-standard notation for the indirect addressing modes used by the UCSD assembler - see page 105 of the manual.

## CREATIVITY LIFE from page 29

Both of these programs were very disappointing and really should not have been included in the package.
In summary, for $\$ 19.95$ the package is a good value. You get four programs of which two are not of good quality (Music and Poem Writing) and two of above average quality (Instant Graphics and Instant People). The Poem Writing and Music programs were big disappointments and the quality of these two should be improved as well as the capability of the programs. However, if you are looking for a nice Hi -res screen design package (of which there are many) The Creativity Life Dynamic Package offers many new and interesting aids in the development of Hi-res displays.

## Apple Fun

We've taken five of our most popular programs and combined them into one tremendous package full of fun and excitement. This disk-based package now offers you these great games:
Mimic-How good is your memory? Here's a chance to find out! Yous Apple will display a sequence of figures on a $3 \times 3$ grid. You must respond with the exact same sequence, within the time limit.

There are five different, increasingly difficult versions of the game, including one that will keep going indefinitely. Mimic is exciting, fast paced and challenging-fun for all!
Air Flight Simulation-Your mission: Take off and land your aircraft without crashing. You're flying blind -on instruments only.
A full tank of fuel gives you a maximum range of about 50 miles. The computer will constantly display updates of your air speed, compass heading and altitude. Your most important instrument is the Angle of Ascent/Bank Indicator. It tells if the plane is climbing or descending, whether banking into a right or left turn.
After you've acquired a few hours of flying time, you can try flying a course against a map or doing aerobatic maneuvers. Get a little more flight time under your belt, the sky's the limit.
Colormaster-Test your powers of deduction as you try to guess the secret color code in this Mastermindtype game. There are two levels of difficulty, and three options of play to vary your games. Not only can you guess the computer's color code, but it will guess yours! It can also serve as referee in a game between two human opponents. Can you make and break the color code...?
Star Ship Attack - Your mission is to protect our orbiting food station satellites from destruction by an enemy star ship. You must capture, destroy or drive off the attacking ship. If you fail, our planet is doomed. .
Trilogy-This contest has its origins in the simple game of tic-tac-toe. The object of the game is to place three of your colors, in a row, into the delta-like, mul-ti-level display. The rows may be horizontal, vertical, diagonal and wrapped around, through the "third dimension'". Your Apple will be trying to do the same. You can even have your Apple play against itself!
Minimum system requirements are an Apple II or Apple II Plus computer with 32 K of memory and one minidisk drive. Mimic requires Applesoft in ROM, all others run in RAM or ROM Applesoft.
Order No. 0161AD \$19.95

## Paddle Fun

This new Apple disk package requires a steady eye and a quick hand at the game paddles! It includes: Invaders-You must destroy an invading fleet of 55 flying saucers while dodging the carpet of bombs they drop. Your bomb shelters will help you-for a while. Our version of a well known arcade game! Requires Applesoft in ROM.
Howitzer-This is a one or two person game in which you must fire upon another howitzer position. This program is written in HIGH-RESOLUTION graphics using different terrain and wind conditions each round to make this a demanding game. The difficulty level can be altered to suit the ability of the players. Requires Applesoft in ROM.
Space Wars-This program has three parts: (1) Two flying saucers meet in laser combat-for two players, (2) two saucers compete to see which can shoot out the most stars-for two players, and (3) one saucer shoots the stars in order to get a higher rank-for one player only. Requires Applesoft.
Golf-Whether you win or lose, you're bound to have fun on our 18 hole Apple golf course. Choose your club and your direction and hope to avoid the sandtraps. Losing too many strokes in the water hazards? You can always increase your handicap. Get off the tee and onto the green with Apple Golf. Requires Applesoft.
The minimum system requirement for this package is an Apple II or Apple II Plus computer with 32 K of memory and one minidisk drive.
Order No. 0163AD \$19.95 money. who wants to tap the limitless energy of our sun. Includes AppleDOS 3.2.
Order No. 0235AD (disk-based version) $\$ 34.95$ students can improve their math skills while playing these games: cheat the hangman. chance to fire at you. depleted and the computer's robot can shoot at yours. move your sub and fire at the enemy fleet.

Order No. 0160AD \$19.95

## Solar Energy For The Home

With the price of fossil fuels rising astronomically, solar space-heating systems are starting to become very attractive. But is solar heat cost-effective for you? This program can answer that question.

Just input this data for your home: location, size, interior details and amount of window space. It will then calculate your current heat loss and the amount of gain from any south facing windows. Then, enter the data for the contemplated solar heating installation. The program will compute the NET heating gain, the cost of conventional fuels vs. solar heat, and the calculated payback period-showing if the investment will save you

Solar Energy for the Home: It's a natural for architects, designers, contractors, homeowners. . . anyone
Minimum system requirements are an Apple II or Apple II Plus with one disk drive and 28 K of RAM.

## Math Fun

The Math Fun package uses the techniques of immediate feedback and positive reinforcement so that
Hanging-A little man is walking up the steps to the hangman's noose. But YOU can save him by answering the decimal math problems posed by the computer. Correct answers will move the man down the steps and

Spellbinder-You are a magician battling a computerized wizard. In order to cast death clouds, fireballs and other magic spells on him, you must correctly answer problems involving fractions.
Whole Space-Pilot your space craft to attack the enemy planet. Each time you give a correct answer to the whole number problems, you can move your ship or fire. But for every wrong answer, the enemy gets a

Car Jump-Make your stunt car jump the ramps. Each correct answer will increase the number of buses your car must jump over. These problems involve calculating the areas of different geometric figures.
Robot Duel-Fire your laser at the computer's robot. If you give the correct answer to problems on calculating volumes, your robot can shoot at his opponent. If you give the wrong answer, your shield power will be

Sub Attack-Practice using percentages as you maneuver your sub into the harbor. A correct answer lets you
All of these programs run in Applesoft BASIC, except Whole Space, which requires Integer BASIC.

## Buon giorno, signore!

Welcome to the province of Santa Paravia. As your steward, I hope you will enjoy your reign here. I feel sure that you will find it, shall we say, profitable.

Perhaps I should acquaint you with our little domain. It is not a wealthy area, signore, but riches and glory are possible for one who is aware of political realities. These realities include your serfs. They constantly request more food from your grain reserves, grain that could be sold instead for gold florins. And should your justice become a trifle harsh, they will flee to other lands.

Yet another concern is the weather. If it is good, so is the harvest. But the rats may eat much of our surplus and we have had years of drought when famine threatened our population.

Certainly, the administration of a growing city-state will require tax revenues. And where better to gather such funds than the local
 marketplaces and mills? You may find it necessary to increase custom duties or tax the incomes of the merchants and nobles. Whatever you do, there will be farreaching consequences... and, perhaps, an elevation of your noble title.

Your standing will surely be enhanced by building a new palace or a magnificent cattedrale. You will do well to increase your landholdings, if you also equip a few units of soldiers. There is, alas, no small need for soldiery here, for the unscrupulous Baron Peppone may invade you at any time.

To measure your progress, the official cartographer will draw you a mappa. From
it, you can see how much land you hold. how much of it is under the plow and how adequate your defenses are. We are unique in that here, the map IS the territory.
I trust that I have been of help, signore. I look forward to the day when I may address you as His Royal Highness, King of Santa Paravia. Buona fortuna or, as you say, "Good luck". For the Apple 48K.
Order No. 0174A \$9.95 (cassette version).
Order No. 0229AD \$19.95 (disk version).

## 16K Ram Expansion Board for the Apple II* \$125.00

- expands your 48K Apple to 64K of programmable memory
- works with Microsoft Z-80 card, Visicalc, LISA ver 2.0 and other software
- eliminates the need for an Applesoft* or Integer Basic ROM Card
- switch selection of RAM or mother board ROM language
- includes installation and use manual
- fully assembled and tested

Visa and MasterCard accepted
Shipping and handling will be added unless the order is accompanied by a check or money order
N.C. residents add $4 \%$ sales tax

# INSIDE THE SILENTYPE FIRMWARE 

by J.D. Eisenberg<br>and A.J. Hertzfeld

The current Silentype firmware gives you an easy way to print text and copy graphics screens with variable margins, print intensity, printing direction. Some applications, however, require greater control over the Silentype (for example, to print your own character sets or special graphics). This document will tell you how to access the lower-level routines in the Silentype firmware to get this control. This document is written with the assumption that you have read the Silentype Operation and Reference Manual, and have your Silentype interface card plugged into slot one.

In essence, the Silentype printer consists of a movable print head made of seven wires positioned vertically. Once the printer is ena-
bled, the print head produces output by heating the wires and burning dots into the special thermal paper as it moves. The print head can print about five hundred vertical columns. The exact number varies from printer to printer as the Silentype is, after all, a mechanical device.
Thus, to get absolute control over the Silentype, you need to know how to

* initialize and enable the printer
* specify the vertical dots to be printed
* and tell the head which direction to move.

## Initializing and Enabling the Printer

From BASIC, you can initialize the printer by executing:
PR\#1

In Pascal, booting the system will automatically initialize the printer; executing:

UNITCLEAR(6)
will achieve the same effect.
After the printer is initialized, you must enable the printer ROMs before you take any further action. This is done by accessing memory locations $\$$ CFFF and $\$ \mathrm{Cn} 00$ where n is the number of the slot your interface card is plugged into [in this case, \$C100].

In BASIC, you accomplish this via:
100 POKE -12289,0: REM \$CFFF
110 POKE -16128,0: REM \$C100 In Pascal, invoke the procedure

## ROMENABLE;

which is listed in Appendix A.
NOTE: Other interface cards used in the Apple may access the same ROM space as the Silentype interface card. Thus, it is a good idea to re-enable the ROMS when you go to use the Silentype after using another device. The Pascal routines in Appendix A will do this automatically; ROMENABLE is included merely for the sake of completeness.

## Printing a Column of Dots

Now that the printer is enabled, you would like to print a column of seven dots. To do this, place the dot pattern you want in address \$CF2B, and jump to the firmware subroutine at address \$CBOB. The dot pattern is arranged as follows: bit seven (the high-order bit) of this byte is ignored. Bit six appears as the top of the column, and bit zero (the low-order bit) as the bottom. Thus:
This byte:

$$
\begin{array}{llllllll}
7 & 6 & 5 & 4 & 3 & 2 & 1 & 0 \\
& X & & X & X & & X & X
\end{array}
$$

where $X$ represents a bit that is on (a value of \$5D) is printed vertically as:

6X
5
4X
3X
2
1X
0X
In BASIC, you print a column of dots via:

## 200 POKE -12501,byte: REM store pattern <br> 210 CALL-13557: REM and print it

and in Pascal via
PRINTCOL(byte)
where byte is the value you wish printed.

## Moving Downwards

With this information, you now can print a line of individual columns.

To print another line, you must move the paper downwards. The paper moves down in "steps". The column of seven dots happens to be exactly four paper steps tall. That is, one downward paper step is $7 / 4$ dot tali. [No kidding. Blame it on the Trendcom people, not us!] So, if you move the paper down four steps, the next line will abut exactly with the line above it [great for graphics]. If you want some separation between lines, move the paper downwards more than four steps. Text lines, for instance, in normal printing mode are separated by six steps (ten and a half dots).

To step the paper downwards by n steps, load the 6502 accumulator with the number $n$, and then call the firmware subroutine at \$CCAB.

In BASIC, you can't load the accumulator; you'll have to use assembly language for that. In Pascal, invoke:

## STEPDOWN (n);

In BASIC, you can do a text line feed (that is, six steps), by calling the firmware subroutine at address \$CCD9:

300 CALL -13095: RFM text line feed
and in Pascal, invoke:

## LINEFEED;

## Reversing Direction

You have now printed a line of columns, and moved the paper down. At this point you may wish to switch directions and print columns going the other way [right to left].

The firmware routine at address \$CCA1 sets the head direction to move from left to right. The routine at address \$CC98 sets head direction to move from right to left. Thus, in BASIC:
400 CALL -13151: REM left to right
410 CALL -13160: REM right to left
and in Pascal, a call to
SETL2R(TRUE); (* set left to right*)
SETL2R(FALSE); (* set right to left *)
The current print direction is stored in bit seven of address \$CF01.

You may interrogate this value in BASIC by:

## 500 I=PEEK(-12543)

If the value you get in $I$ is less than 128, the current direction is left to right; otherwise it is right to left.

In Pascal, the function LEFT2 RIGHT will return TRUE if you are headed left to right, FALSE otherwise. For example:

## IF LEFT2RIGHT THEN WRITE('Going to the right.') ELSE WRITE('Going to the left.');

NOTE: The other bits of address \$CF01 contain information for the Silentype's internal use. Don't mess with them.

## Physical Left Margin

As stated before, the Silentype is a mechanical device. If you continually reverse direction without ever aligning yourself at the physical left margin of the printer, your output will eventually become misaligned by several dots. In order to return to the true physical left margin to recalibrate, you call the firmware subroutine at address \$CBBC. In BASIC, execute:

## 600 CALL -13380: REM <br> recalibrate

and in Pascal, invoke:

## RECALIBRATE;

It is suggested that you go back to the physical left margin at least once every two lines, and set your direction to left to right in order to avoid this problem.

## Locking the Print Head

The Silentype will produce the best printout if the head is kept moving at a steady pace. If you need to stop and start printing (for example, if you need to do some lengthy calculation in between columns), you should lock the print head in order to keep it from coasting onwards in its current direction. This can be done by a call to the firmware subroutine at address \$CBA8. In BASIC,

## 700 CALL -13400: REM to lock head

and in Pascal, invoke:

## LOCKHEAD;

## WARNING!

The Silentype draws upon the Apple's power supply in order to heat the wires to burn the paper. It is a bad idea to print mass quantities of black for long periods of time; it shortens print head life and puts a drain on the power supply. UNDER NO CIRCUMSTANCES SHOULD YOU PRINT ANYTHING (especially not a dark image) WHILE THE DISK IS SPINNING! The combined power drain may potentially damage the power supply on some Apples. In order to avoid this situation, wait two seconds after a disk access to allow the disk to "time out" before you start to print. The Silentype firmware routine does this before it prints a graphic image, and so should you!

## Other Miscellaneous Routines

The firmware subroutine at location \$CD02 will seek the physical left margin, set the direction to left to right, and then move the print head to the software left margin, stored at address \$CF11. In BASIC:

## 800 CALL -13054: REM seek soft left margin

and in Pascal, invoke:
SOFTLEFT;
You can move up to 256 dots in the current horizontal direction by loading a number between zero and 255 into the accumulator (a value of zero moves 256 dots), and calling the subroutine at location \$CC4E. In BASIC you can't load the accumulator; in Pascal, invoke:

## SKIPDOTS(ndots)

where ndots is an integer expression between zero and 255 .
A sample program in Pascal that uses some of the routines discussed above may be found in Appendix B.

## Using a Different Character Set

The routines given above give you control over the Silentype for arbitrary graphics.

In many cases, however, you simply want to use a different character set, without having to go through all the trouble of stepping the paper downward, keeping account of direction yourself, etc.

The Silentype firmware has been written with these situations in mind. When the Silentype prints text and needs the next column of dots for a letter, it does a JuMP indirect to a subroutine that returns the next column. The address of that subroutine is stored in locations \$CF09 and \$CF0A. Location \$CFOB tells the Silentype how many columns are in each character. Normally, locations \$CF09 and \$CF0A contain the address \$CC1B; the address of the routine that fetches the next column of dots for ordinary text. Location \$CFOB normally contains six (five columns needed per character, plus one blank column).

You may, however, replace the contents of locations \$CF09 and \$CFOA with the address of a routine of your own to provide a column of dots, and the contents of location \$CFOB with a number telling how
many dots wide your special characters are. Then, when the Silentype is printing text and needs a column of dots, it will call your routine. It will send you the following information:

* The text character that it is printing is in the A-register (accumulator).
* Location $\$ 26$ tells which column of dots in that letter the Silentype would like to be given. This column is relative to the current direction. When the Silentype is printing from left to right and wants column zero of a character, that's the rightmost column of dots. When printing right to left, column zero calls for the leftmost column of dots. You can determine the direction by looking at the high bit of location \$CF01.

The Silentype gives you this information; you do your calculations or table lookup and return the column of dots that it requested into location \$CF2B.

An example of a routine that does bold letters is in Appendix C.

## BINARY-TO-DECIMAL SHORTCUT (SMALL IS BEAUTIFUL)

by Steve Wozniak

When writing programs in machine language, it is generally preferable to calculate in binary, but to display in decimal. When a page number, game score, or the like must be printed, a 'binary-todecimal' subroutine can be called. The general technique for converting an integer from one radix (base) to another is to repeatedly divide the argument by the radix of the result, retaining the remainders as successively more significant digits of that result. The process is terminated when the argument is reduced to zero by the divisions.

A better (shorter and faster) binary-to-decimal conversion algorithm can be implemented on processors supporting packed decimal (BCD) operations, such as the 6502. The following algorithm assumes that a 2-byte unsigned binary argument is in variables HEX0 (low order) and HEX1 (high order), and that the result is generated in variables DEC0 (low order), DEC1, and DEC2 (high order).
(1) Clear the result DEC0, DEC1, and DEC2. Set the processor DECIMAL mode, if any.
(2) Shift the binary argument (HEX0 and HEX1) left, the most significant bit into the CARRY.
(3) Perform the calculation

RESULT <-- RESULT * 2 = CARRY by adding the result (DEC0, DEC1, and DEC2) to itself (plus the CARRY) in decimal mode.
(4) Perform steps (2) and (3) a total
of 16 times.

The algorithm works as follows. The first bit shifted out of the binary argument carries a weight of 2 to the 15th. It is added to the result which is subsequently doubled 15 times (in decimal), restoring the proper weight component. Each bit is treated in this manner.
The high-order result byte, DEC2, can be shifted left at step (3) instead of added to itself in decimal since it will not exceed 9 (\$FFFF $=06$ 5535 ). If this is done, DEC2 need not be initialized to zero, since the original contents will be shifted out during execution. This optimization is implemented in the following 6502 subroutine.

--- END ASSEMBLY ---
TOTAL ERRORS: 0

## Sirius Software Presents

## Software For Your Apple

## Cyber Strike

Cyber Strike is brand new for the Apple. A full 48 K of assembly language programming with animation and original 3D effects that you haven't seen on the Apple before. INCREDIBLE! Everyone said a game like this wasn't possible on the Apple but we did it; also includes a real time clock (software implemented) and several levels of play. Uses either 13 or 16 sector Apple II, IIt, or III. WARNING, THIS GAME REQUIRES PRACTICE AND FAST REFLEXES. Three levels of play and they're all tough.

## E-Z Draw

E-Z Draw has not just been updated to 3.3 DOS; we've done a complete rewrite. E-Z Draw now includes the powerful Higher Text character generator written by Ron and Darrel Aldrich. With our new routines the fonts or any part of the picture can be flipped upside down, slanted right or left, rotated 90 or 180 degrees, mirrored, or any combination. Also the fonts or parts of the screen can be expanded in width or height, or compressed in height or width. You can mix portions of pictures together, or save only a portion of the screen on disk. Now fully keyboard controlled for better accuracy. Professional documentation and 20 different and imaginative type styles. Includes commands to print on silentype printers.

## Star Cruiser and Both Barrels

Star Cruiser sold over 2000 copies in the first 3 weeks and is still selling strong. Super Invader..eat your heart out. Star Cruiser is a fast action arcade game that can be played by ages 3 and up and remains a challenge to all. Requires a 32 K Apple II or II +. Both Barrels seems to be attracting the younger set. This package features two games; High Noon and Duck Hunt. Fun, cute, amusing, original, and it sells. You'll love the bad guy that falls off the roof and the dogs fighting over the ducks.

Apple is a registered trademark of Apple Computer, Inc. Higher Text is a copyrighted product of Synergistic Software. Star Cruiser, E-Z Draw 3.3, Both Barrels, Duck Hunt, High Noon, and Cyber Strike are all copyrighted products of SIRIUS SOFTWARE. All rights reserved.

# TABBING WITH APPLE PERIPHERALS 

by John Crossley<br>Apple Computer, Inc.

## INTRODUCTION:

This driver allows the user to TAB normally without substituting POKE $36, \mathrm{X}$ for $\operatorname{TAB}(X)$. IT DOES REQUIRE THAT THE PR\#(slot) be replaced with a CALL wherever it occurs in the program and that DOS 3.2 or 3.2.1 is in the system. It is customized for a certain type of interface in a certain slot when it is entered and will not work in any other configuration.
SOFTWARE ENTRY
First you must determine the value for the four variable parameters for the card. Look at the table for the interface that you will be using and determine the value for $A, B, C$, and $D$ for the slot that the interface will be used in.

PARALLEL INTERFACE
$\begin{array}{llllllll} \\ \text { SLOT } & 1 & 2 & 3 & 4 & 5 & 6 & 7\end{array}$
A 02020202020202
B C1 C2 C3 C4 C5 C6 C7. C F9 FA FB FC FDFE FF
D 07070707070707
SERIAL INTERFACE
SLOT $\begin{array}{llllllll}1 & 2 & 3 & 4 & 5 & 6 & 7\end{array}$
A 07070707070707
B C1 C2 C3 C4 C5 C6 C7
C F9 FA FB FC FDFE FF
D 05050505050505

```
SILENTYPE PRINTER
SLOT \(\begin{array}{llllllll}1 & 2 & 3 & 4 & 5 & 6 & 7\end{array}\) A 07070707070707
B C1 C2 C3 C4 C5 C6 C7 C 04040404040404
D CF CF CF CF CF CF CF
```

## COMMUNICATIONS CARD PRINT ROUTINE

$$
A=07 B=03 C=02 D=03
$$

Enter the monitor with CALL -155 and, using the value from the above tables for the items within ' $<>$ ', type:
3B0:A9 < SLOT >
:20 95 FE
:A9 8D
:20 ED FD
:A9 C5
:85 36
:A9 03
:85 37
:4C EA 03
:20<A><B>
:48
:AD < C > < D >
:85 24
:68
:60
To check your typing, type:
3BOL
and compare your listing to the one below for a parallel interface in slot 1.

| 03B0- A9 01 | LDA \#\$01 |
| :--- | :--- |
| 03B2- 20 95 FE | JSR \$FE95 |
| 03B5- A9 8D | LDA \#\$8D |
| 03B7- 20 ED FD | JSR \$FDED |
| 03BA- A9 C5 | LDA \#\$C5 |
| 03BC- 85 36 | STA \$36 |
| 03BE- A9 03 | LDA \#\$03 |
| 03C0- 85 37 | STA \$37 |
| 03C2- 4C EA 03 | JMP \$03EA |
| 03C5- 20 02 C1 | JSR \$C102 |
| 03C8- 48 | PHA |
| 0369- AD F9 07 | LDA \$07F9 |
| 03CC- 85 24 | STA \$24 |
| 03CE- 68 | PLA |
| 03CF- 60 | RTS |

Now return to BASIC with 3D0G.
SAVING THE PROGRAM TO DISK:
The driver should be in memory before the printer is used. Save the driver by typing:

BSAVE TABBER, A\$3B0, L\$20
USING THE PRINTER:
NOTE: If the Apple's video is enabled, don't tab past the 40th column. It may ruin your program.
The first time you want to use the printer you must load the driver. From command mode, type:

## BLOAD TABBER

This may be done from a program by entering:
100 PRINT D\$;"BLOAD TABBER"
assuming that $\mathrm{D} \$$ is a control-D.
The first time the printer is needed, the interface must be initialized. CALL 944 will turn on the printer and send out a carriage return to initialize the interface. Subsequently, initialization is not needed and CALL 954 will return to the printer without printing a carriage return.

Don't use PR\#1, use CALL 944 or CALL 954.

Most of these interfaces have parameters that can be POKEd to modify the interface and the Parallel Printer Interface has its ctrlI commands. These POKEs and commands should be issued just after the CALL 944. They needn't be repeated after the CALL 954.

When you want to switch back to the video monitor for output type PR\#0. From within a program this must be in the form of
200 PRINT D\$;"PR\#0"

EXAMPLE PROGRAM:
100 LET D\$= CHR $\$$ (4)
110 PRINT D\$;"BLOAD TABBER"
120 CALL 944
130 PRINT "THIS WILL BE PRINTED"
140 PRINT D\$;"PR\#0"
150 PRINT "AND NOW BACK TO THE SCREEN"
160 CALL 954
170 PRINT "NOW FOR A
TABBING DEMO"
180 FOR J=1 TO 76 STEP 5
190 PRINT TAB(J);J;
200 NEXT J
210 PRINT
220 PRINT D\$;"PR\#0"
230 END

# APPLE WRITER AND THE TELEPHONE 

by Jim Hoyt<br>Apple Computer, Inc.

Here's a quick and easy method for transmitting your Apple Writer files from your Apple to another using the telephone. As written, the programs use the Apple Communications Card and an acoustic modem, although not much programming effort would be required to make them work with an auto-answer/auto-dial modem.

As a little history, these programs were written for an Apple dealer in London. It seems that some method to move files from several widely separated Apples in solicitors (attorneys) offices to a central printing station was a good idea. Prices of letter quality printers being what they are in England, what with V.A.T., import duties, etc., it makes good sense to provide one office rather than equip all offices with expensive printers. These programs fill that need quite nicely.

These programs will execute in a 48 K system with Applesoft in ROM. They could easily be re-written in Integer Basic. Here's what they do: PROGRAM ONE (HELLO)

This is the "HELLO" program on the diskette. It allows a choice of transmitting, receiving or exiting the system. When the third option is chosen, a DOS " FP " command is issued to reset the system to its start-up parameters. (Too few programs do this and it's always a nuisance to get a "PROGRAM TOO LARGE" error because HIMEM, LOMEM or program pointers have been changed by some previous program run.)

```
LOAD HELLO
JLIST
1 GOTO 1000
2 PRINT CHR\$ (4)"SAVEHELLO" : END
1000 REM
HELLO (MENU PROGRAM)
1010 TEXT:HOME:PRINT "------
```

-";
1020 PRINT " APPLE COMPUTER APPLE WRITER MOVER
": PRINT " $\qquad$ -"
1030 HIMEM: 6400:D\$ = CHR\$ (4)
:Q\$ = CHR\$ (34)
1040 VTAB 7: PRINT" YOU MAY CHOOSE FROM THE FOLL OWING:"
1050 VTAB 11: PRINT" 1. TRAN
SMIT APPLE WRITER
FILES": PRINT
1060 PRINT " 2. RECEIVE APPLE WRITER FILES": PRINT
1070 PRINT " 3. QUIT THIS PRO GRAM"
1080 VTAB 19: HTAB 1: PRINT "E NTER YOUR CHOICE BY NUMBER AND PRESS": PRINT "THE"Q\$"RETURN" Q\$" KEY: ";: CALL-958: IN PUT "";A\$
1090 LET A = VAL (A\$): IF A < 1 OR A>3 THEN VTAB 23:
HTAB 12: PRINT "INVALID
RESPONSE": FOR I = 1 to
1000: NEXT : GOTO 1080
1100 ON A GOTO 1110, 1120, 1130
1110 PRINT D\$"RUNTRANS MIT';
1120 PRINT D\$"RUNRECEIVE"
1130 HOME: VTAB 22: PRINT D\$ "FP"

PROGRAM TWO (TRANSMIT)
A little customizing is needed here. Set the variable "MS" in line 1030 to the slot number in which the Comm Card is inserted. Line 1040 prompts for the name of the file to transmit and if a Carriage Return is entered will provide a Catalog of the diskette. Line 1050 BLOADS the file. Note that all Apple Writer files start at the same address. Lines 1060 through 1090 prompt you to go ahead and give you a chance to change your mind. Line 1100 delays a bit to give the person on the other end time to get the phone handset into the modem, initializes the interface card, then POKEs Apple Writer's Beginning of File mark (131). All the work is done in line 1110. The PEEKed byte is printed both on the screen and to the modem, if the End Of File mark is not found, the address counter (AD) is incremented and we go back for another byte. That's it.

## LOAD TRANSMIT

JLIST
1 GOTO 1000
2 PRINT CHR\$ (4) "SAVETRANS MIT": END 1000 REM

TRANSMIT PROGRAM
1010 TEXT:HOME:PRINT "------
-";
1020 PRINT "APPLE COMPUTE
R TRANSMIT": PRINT "---
----"
1030 HIMEM: 6400:D $\$=$ CHR \$ (4) MS = 2:Q\$ = CHR\$ (34): POK E 34,3: HOME : VTAB 12
1040 PRINT "FILE TO SEND: TEX T.";: INPUT "";'A\$: IF NOT LEN (A\$) THEN HOME : PRI NT D\$"CATALOG": PRINT : GOTO 1040
1050 PRINT D\$"BLOADTEXT. "A \$",A\$1900"
1060 HOME : VTAB 12: HTAB 9: PRINT "PRESS "Q\$"RETUR N"Q\$" TO TRANSMIT": PRI NT : HTAB 15: PRINT Q\$"ES C"Q\$" TO QUIT..."
1065 VTAB 22: PRINT "ASSURE THAT MODEM IS IN "Q\$" ORIGINATE"Q\$" MODE"

```
1070 VTAB 14: HTAB 11: GET A$:
    PRINT : IF ASC (A$) = 27
    THEN PRINT D$"RUN
    HELLO": END
1080 IF ASC (A$) = 13 THEN 1100
1090 PRINT CHR$ (7);: GOTO
    1070
1100 HOME : VTAB 12: HTAB 14:
    PRINT "SETTING UP...":
    FOR I = 1 TO 10000:
    NEXT : HOME : VTAB 12:
    PRINT" NOW SENDING
    DATA:": PRINT D$"PR#"MS
    :AD = 6400: POKE 6400,131
1110 VTAB 12: HTAB 28: PRINT
    PEEK (AD): CALL - 868: IF
    PEEK (AD) < > 96 THEN
    AD = AD + 1: GOTO 1110
1120 PRINT D$"PR#0": PRINT
    CHR$ (7): HOME
1130 VTAB 12: PRINT "SEND
    ANOTHER FILE? ";: CALL -
    958: INPUT "";A$: IF LEFT$
    (A$,1) = "Y" THEN GOTO
    1030
1140 IF LEFT$ (A$,1) = "N" THEN
    PRINT D$"RUNHELLO":
    END
1150 GOTO 1130
```

PROGRAM THREE (RECEIVE)
Again, set "MS" to your modem slot. The important line in this module is 1140 . POKE 50,128 resets the prompt character from a "?" to a space. The NORMAL command re-sets it. When the EOF mark (96) is found, the user is prompted for a file name to save and the program re-exectues.

## LOAD RECEIVE

JLIST
1 GOTO 1000
2 PRINT CHR\$ (4) "SAVE RECEIVE": END
1000 REM
RECEIVE PROGRAM
1010 HIMEM: 6400: TEXT:HOME : PRINT " ----------------";
1020 PRINT "APPLE COMPUT ER RECEIVE": PRINT "--

1170 PRINT D\$"BSAVETEXT."A \$",A\$1900,L"AD - 6399
1180 GOTO 1040

# DOW JONES NEWS \& QUOTES REPORTER 

Selected Business News at the Touch of a Key

The Dow Jones News \& Quotes Reporter is a powerful business software package, designed especially for investors, busy managers, and executives who need fast access to stock market news and information. It allows users to retrieve - over telephone lines - past and current news stories and headlines from The Dow Jones News/Retrieval Service, The Wall Street Journal, and Barron's, as well as quotations for more than 6000 securities traded on the major exchanges.

News \& Quotes Reporter can also be used in conjunction with Portfolio Evaluator, another Dow Jones program from Apple. Portfolio Evaluator allows you to store, modify, and update approximately 100 individual
portfolios of up to 50 stocks each on a single diskette. This capability coupled with News \& Quotes Reporter's access to late-breaking financial news and stock quotations - provides the tools and information needed for sophisticated portfolio creation and management.

The Dow Jones News \& Quotes Reporter is your personal key to making sound investment decisions in a rapidly changing world.

## BENEFITS

The Dow Jones News \& Quotes Reporter package...

- Saves time spent skimming and searching through business media, by putting financial headlines and news stories at your fingertips...
- Keeps you informed of stock price fluctuations, by providing fast access to stock quotations for more than 6,000 securities on all the major stock exchanges...
- Renders concise records for business or tax purposes through a monthly Dow Jones billing.
DOW JONES NEWS \& QUOTES REPORTER - A CLOSER LOOK
The main menu of the Dow Jones News \& Quotes Reporter contains five program selections. With News \& Quotes Reporter, you can access, display, and print news headlines and entire stories from the worldwide network of the Dow Jones News/Retrieval Service, The Wall Street Journal, and Barron's. You can also access timely stock and composite quotes on more than 6,000 corporate stocks and bonds, options, mutual funds, and treasury notes and bonds on the New York, the American, the Mid West, and the Pacific stock exchanges, plus the over-the-counter market (OTC NASDAQ).

You can "log on" to the Dow Jones News/Retrieval Service over telephone lines, using either an autodial or acoustical modem and a special password, obtained from your dealer when you purchase Apple's Dow Jones News \& Quotes Reporter. To access news items, select NEWS RETRIEVAL SERVICE from the main menu. Your Apple II System automatically initiates the log-on procedure, even automatically dialing the correct phone number if you have an auto-dial modem.

You can obtain news either by category or company. For example, you may be interested in up-to-the-minute foreign news - say, from the Mid-East - or in current stories concerning aerospace, mining, or a particular company in which you're interested. Using NEWS RETRIEVAL SERVICE, simply enter the appropriate symbol. Then choose the most recent news story, or the first page of subject-related headlines. There may be less than a page or many pages of headlines, listing some stories as far back as three months.

Using one of serveral suggested printers (see System Configuration), you can also print news stories in their entirety, or the full list of headlines (one page at a time). Simply type the "!" symbol, and the news item or list of headlines that you're reading on the video monitor will be printed.
Another selection option available from the main menu is STOCK QUOTE SERVICE, which allows you to access Dow Jones' securities quote data base and obtain current stock quotations. (To conform with federal regulations, stock quotations are delayed 15 minutes.) As it does with NEWS RETRIEVAL SERVICE, News \& Quotes Reporter leads you step-by-step through the STOCK QUOTE SERVICE procedures.
Suppose, for example, that you're reading a current news story. about a company in which you own stock, and you encounter a competitor's name. With the News \& Quotes Reporter, it takes but a few keystrokes to return to the menu, select the Stock Quote

Service Program, and find the trading price of the competitor's stock.

The third option on News \& Quotes Reporter's main menu, CUSTOMIZING FEATURES, allows you to print news stories either at 40 or 80 columns wide. You can switch easily from 80 -column hardcopy for news stories, to 40 -column hardcopy for the Dow Jones Industrial Averages. CUSTOMIZING FEATURES also lets you enter and maintain your password (supplied by Dow Jones), and enter and maintain two telephone numbers for use with an auto-dial modem.
Selection 4, DISCONNECT DOW JONES, simply disconnects your line from the Dow Jones phone number. With this option you "hang up" and don't continue paying connect-time charges, but your system is left still running, connected, and ready to log back on, as soon as you need News \& Quotes Reporter again. Selection 5, EXIT NEWS \& QUOTES REPORTER, terminates the News \& Quotes Reporter program. If you're using an autodial modem, you will be reminded to unplug your line and reconnect it to your phone; with an acoustical modem, you'll be reminded to hang up your phone.

## SYSTEM CONFIGURATION

To use the Dow Jones News \& Quotes Reporter you will need:

- Apple II or Apple II Plus, each with a minimum 48 K of memory; or
- Apple II with the Apple Language System;
- Apple Disk II with controller and 16 -sector PROMs;
- Apple Modem IIB, with Apple Communications Interface Card;
- A video monitor or television;
- A standard, working telephone;
- A printer and interface card* (optional);
* Note: The Apple Computer System works with several printers and appropriate interface cards, including the following:
- Apple Silentype Printer Card: Silentype Interface Card (supplied with printer)
- Printer IIA

Card: Centronics 779 Printer Interface Card (Apple Product A2B0007, included if printer is purchased from Apple Computer Inc.)

- Qume 5/45

Card: High Speed Serial Interface Card (Apple Product A2B0005) with P8-02 PROM

## TECHNICAL SPECIFICATIONS

Language: Written in Pascal (Run Only)

Dow Jones Access: 15-minute tape delay; exchanges include NYSE, AMEX, Mid West, Pacific, Composite, and OTC NASDAQ.
NOTE: The cost of the Dow Jones News \& Quotes Reporter package includes the one-time password fee necessary to use the Dow Jones News/Retrieval Service. In addition, there are also Dow Jones connect-time charges. If you already own Apple's Portfolio Evaluator program, then you've paid for and received a password that's usable with News \& Quotes Reporter. Though you have to pay the password fee again as part of the News \& Quotes Reporter package, the amount will be credited to your Dow Jones account. Your dealer can further explain these arrangements to you.
THE DOW JONES NEWS \& QUOTES REPORTER PACKAGE Order No. A2D0030
With your News \& Quotes Reporter order, you will receive:

- Apple's Dow Jones News \& Quotes Reporter master diskette;
- Apple's Dow Jones News \& Quotes Reporter back-up diskette;
- Apple's Dow Jones News \& Quotes Reporter Instruction Manual;
- Dow Jones News/Retrieval and Stock Symbol Guide;
- Dow Jones News/Retrieval Service contract and password;
- One hour of free training time, to be used during non-prime time hours, within 15 days of purchase of the News \& Quotes Reporter package.

# CONVERTING STRINGS TO NUMERIC VARIABLES 

by Jo and Charlie Kellner

Apple Pascal doesn't allow input editing for integers and reals. This can cause a lot of trouble if the wrong data is entered by mistake: either the program is stuck with bad data, or worse yet, the system may crash.

STRINGSTUF is an intrinsic unit which is designed to avoid this problem. All data is entered in the form of strings, then converted to the appropriate data format by the unit. This allows editing while the data is in string form.

Note: The STRINGSTUF unit and accompanying demo program are designed to run in the new release of Pascal, version 1.1 only. Long integers are not supported in STRINGSTUF.

## THE UNIT

STRINGSTUF may be located in any unused segment number 17-31. Install in SYSTEM.LIBRARY, following the instructions in the Pascal reference manual.

```
(*$S+*)
(*$LPRINTER:*)
UNIT STRINGSTUF; INTRINSIC CODE 26;

## PASCAL RUN-TIME ERRORS

by Jo Kellner Apple Computer, Inc.

Run-time errors generate a message plus a set of numbers that indicate which instruction was being executed when the error occurred. " S " stands for "SEGMENT". "P" for "PROCEDURE", and " $I$ " for "INSTRUCTION COUNT". These can be correlated with the textfile by using the System List option (*\$L<filename>*) when doing a compile. This will produce an annotated listing of the text, with the $\mathrm{S}, \mathrm{P}$, and I numbers included.

For example, here is a very simple program which has been compiled with the listing option:

A word of warning: do NOT use $\mathrm{L}+$ as the option, as this will result in the loss of your code file and possibly your operating system. Instead, name a disk file that will be placed on a different volume from the destination of the code file, or better yet, use (*\$LPRINTER:*) to put the listing directly onto your printer.

KEY:
(1) Line number of text
(2) Segment number (S\#) - S\# values which do not appear in your listing indicate that the error has occurred in that segment of the operating system. S\#0 is SYSTEM. PASCAL, and 17-31 are usually SYSTEM.LIBRARY segments.
(3) Procedure number (P\#) - the procedure number within the segment designated by the $S \#$.
(4) Nesting level ( $D=$ declaration)
(5) Instruction count (I\#) - this is the instruction count from the beginning of the procedure. The number indicates the count at the beginning of each line, so a value between two lines simply means that the error occurred in the middle of the line.

## Saving and Loading Arrays in Applesoft

Have you ever encountered an application in which you've had a large array filled with valuable data and then you wanted to save that array to the disk? Those of you who have tried to save the array, element by element, using Applesoft BASIC, have probably wondered if there might be a faster way to get the array on and off the disk. This article wil discuss a method for using BSAVE and BLOAD to store arrays on disk and retrieve them for use with Applesoft programs, without trashing your variables or the program.

## Numeric Arrays

The following subroutine will BSAVE or BLOAD an array of real numbers in Applesoft. It uses two variables ( A and $\mathrm{N} \$$ ) which will contain the starting address of the array and the name of the array to be saved to disk.

```
1000 A=0: GOSUB }106
1010 PRINT CHR$(4); "BSAVE
    ARRAY";N$" ,A";A;",L";PEEK
    (A+2) + PEEK (A+3) * 256
1020 RETURN
1030 A=0: GOSUB 1060
1040 PRINT CHR$(4); "BLOAD
    ARRAY";N$;" ,A";A
1050 RETURN
1060 A=PEEK(107) + PEEK(108)
    *256
1070 IF LEN (N$) = 1 THEN }109
1080 IF PEEK(A+1)<> ASC
    (MID$ (N$,2,1)) THEN }111
1090 IF PEEK(A)<>ASC (LEFT$
    (N$,1)) THEN }111
1100 RETURN
1110 A = A + (PEEK(A+2) +PEEK
    (A+3) *256)
1120 IF A < (PEEK(109) + PEEK
    (110) *256) THEN 1070
1130 PRINT N$;"NOT FOUND":
    RETURN
```

To BSAVE an array of real numbers from your program you would set $N \$$ equal to the name of the array you want to save, then GOSUB 1000. Line 1000 sets the variable ' $A$ ' to zero to insure that space is allocated for the variable
' $A$ '. If this is not done, then when line 1060 is executed, the starting address of the array space will be seven bytes off. This is because the value for the variable is calculated before memory is allocated for the variable. After memory is allocated for the variable the value is stored in memory. But by this time Applesoft memory has been shifted around to make room for the new variable. Therefore, ' $A$ ' is made equal to zero so that space is allocated for the variable before the starting address of the array variable space is calculated.

Line 1060 calculates the starting address of the variable array space in memory and stores this value for future reference in the simple variable ' $A$ '. A simple variable is one that contains a single numeric value or, in the case of simple string variables, one string of characters.
Applesoft arrays have well defined structures in memory. A description of this structure can be found on page 137 of the "Applesoft II BASIC Programming Reference Manual". The address calculated in line 1060 is the starting address for all of the arrays in memory. To find the starting address of the array named in $N \$$, the above subroutine must look through memory to find the name that matches the name in $N \$$. All variable arrays in Applesoft are stored in one continuous chunk of memory, starting at the address contained in location 107 and 108. Each array in this continuous memory space is stored one right after another. When a new array is DIMensioned, this continuous chuck of memory is expanded to make room for the new array. Each array in memory contains information about itself. All the information our routine needs is in the first four bytes of any Applesoft array. The first two of these four bytes contains the name of the array, and the next two bytes contain the length of that array.

Line 1070 through 1090 compare the first two characters of the name in $N \$$ to the array name at the memory location stored in the variable ' $A$ '. Line 1070 ensures that only the necessary characters in $N \$$ are compared with their corresponding values in the first two bytes of the array in memory. If either of the characters in $N \$$ do not match the ASCII values in the first two bytes of the array, then the array we are looking for has not been found. This is when the length bytes of the array in memory come in handy. To find the length of the array the subroutine PEEKs the third and fourth memory locations beyond the address in the variable 'A'. Line 1110 uses the following function to find the length of the array.

## PEEK (A+2) $+\operatorname{PEEK}(\mathrm{A}+3)$ *256

This result is then added to the value in ' $A$ ' to yield the address of the first byte of the next array in memory.

If the name of the array at the address in ' $A$ ' does not match the name in $\mathrm{N} \$$ then control of the routine is transfered to line 1110. Line 1110 changes the address in ' $A$ ' to the first byte of the next array in memory. Then the name of this array can be compared to the name in $N \$$ and the search will continue until all of the arrays in memory are examined or the array in $N \$$ is found.

The chunk of memory for array storage has a limit, and it doesn't do any good to check for arrays beyond this limit. As it turns out, the last address of the array space in memory is stored in zero page locations 109 and 110. If the address in the variable ' $A$ ' is compared to the address in 109 and 110 then we have a way to stop the routine when an array name is not in memory. This in fact is the reason for including line 1120. As long as the address in 109 and 110 is greater than the array address stored in ' $A$ ' the routine continues to search for the array name in $N \$$.

When the array is found in memory, program control is transferred to the next statement following the GOSUB that called the search routine to start with. If a GOSUB 1000 was performed then the array in memory is BSAVED. If a GOSUB 1030 is performed then a

BLOAD overwrites the array in memory.

## Assumptions and Cautions:

The above routine assumes that the name of the array has been placed in $N \$$ before a GOSUB 1000 or GOSUB 1030 is performed. If the array is to be BLOADed, then it must be DIMensioned (using the DIM statement) to the same size as the array that was BSAVED. In other words if the array $A(10,20)$ was saved to disk and it is to be loaded into memory again, then the array must be DIMensioned as $\mathrm{A}(10,20)$ in the program before loading the array. The routine listed above also assumes that the array being loaded or saved is a real number array. To load and save integer arrays, make the following modification to lines 1080 and 1090.
1080 IF PEEK $(\mathrm{A}+1)<>$ (ASC
(MID\$ (N\$,2,1)) i+128
THEN 1110
1090 IF PEEK (A) $<>$ (ASC (LEFT\$ (N\$,1)))+128 THEN 1110
With the above changes, the routine will load and save integer arrays only.

The following program illustrates the use of this subroutine for BLOADing arrays.

```
10 DIM A(10,20),CV(50)
20 FOR I = 0 TO 10
30 FOR J = 0 TO 20
40 A(I,J) = J + I
50 NEXT J
60 NEXT I
70 FOR I=0 TO 50
80 CV(I) = I
90 NEXT I
100 N$ = "CV"
1 1 0 \text { GOSUB 1000: REM SAVE}
    THE ARRAY CV(50)
120 N$ = "A"
130 GOSUB 1000: REM SAVE
    THE ARRAY A(10,20)
140 END: REM REAL NUMBER
    ARRAY SUBROUTINE
    STARTS HERE
1000 A = 0: GOSUB }106
1 0 1 0
```

## 1130 PRINT N\$; " NOT FOUND": RETURN

When this program is run, the arrays ' $A$ ' and 'CV' will be saved to
the disk. To load the real number arrays back into memory, enter the following program.

```
10 DIM CV(50), A(10,20)
20 N$ = "A"
30 GOSUB 1030: REM LOAD
    ARRAY "A"
40 FOR I = 0 TO 10
50 FOR J = 0 TO 20
60 PRINT A(I,J)
7 0 ~ N E X T ~ J ~
8 0 ~ N E X T ~ I ~ I
90 N$ = "CV"
100 GOSUB 1030: REM LOAD
    ARRAY CV
110 FOR I=0 TO 50
120 PRINT CV(I,J)
130 NEXT I
140 END: REM REAL NUMBER
    ARRAY STARTS HERE
1000 A = 0: GOSUB 1060
1010
```

## 1130 PRINT N\$:" NOT FOUND": RETURN

When this program is run, it will print the contents of the real number arrays CV and A .

## THE TAX PLANNER - A Personal Financial Planning Tool

The Tax Planner is an innovative program designed for use with Apple II or Apple II Plus computers. It allows you to determine the federal income tax advantages or liabilities that result from personal financial decisions. You can construct various income scenarios and compare the tax impact of each. This means you can determine the best time to make a financial move (for example, sell property or take gains or losses on investments). And, you can print out your tax strategies, or store them on a diskette, ready for fast retrieval and modification.

In short, the Tax Planner is a tool that can help you manage your personal income through better planning of your tax liability.

## BENEFITS

The Tax Planner. . .

- Provides you with the capability to optimize the federal income tax advantages available to you, because it lets you quickly compare the tax consequences of various financial decisions.
- Assists you in choosing the best time to make certain financial moves by instantly computing their impacts on income taxes in current and future years.
- Helps clarify current federal tax regulations, because you can experiment with various financial scenarios, and observe how the tax mechanisms apply to each.
- Increases your productivity in conducting financial analysis and making financial decisions, by allowing you to quickly develop or change tax strategies.

## THE TAX PLANNER - <br> A CLOSER LOOK

The Tax Planner main menu offers four options:

1. TAX PLANNING - by which you plan your tax strategy.
2. FILE CLERK - by which you manage the diskette storage of your various income and tax scenarios.
3. PRINTER - by which you print
the results of a tax planning scenario.
4. QUIT - by which you exit from the Tax Planner.
To begin using the program, you'd select TAX PLANNING. Before tax computations can be performed, you will be asked to provide some information, including how far into the future you wish to plan (up to nine years), and your base period income for each of the four preceding years. If you choose to plan only for next year, you may specify the number of alternative scenarios to be examined for that year. After you've provided this information, your screen will display the Tax Matrix, a skeletal array of the items which affect your federal income tax situation. These include your tax filing status, income, long- and short-term capital gains or losses, deductions, and adjustments.

Suppose you were planning your 1980 tax situation, plus two years into the future. On the screen, the Tax Matrix will display three columns, labelled 1980, 1981, and 1982. You then provide input information on your projected income and deductions for these years. Simply enter the information into the Tax Matrix on the screen. Once you're satisfied with your projections, request that the Tax Planner compute adjusted gross income, estimated tax, most advantageous tax computation method, and tax bracket - for each of the three years. At any point you may alter your projections and instantly see their consequences.
Setting up the Tax Matrix usually requires some time and careful thought. But once it's complete, the Tax Planner does all the rest of the work - the tedious tax computations - for you. The Tax Planner automatically computes your tax by income averaging as well as by the regular method. It also computes the maximum tax on personal service income, the minimum tax on preference items,
and the alternative minimum tax. In addition, your tax bracket and ; the tax computation method most advantageous to you are determined for each year or alternative within a single year.

With Tax Planner, you can use the Tax Matrix to quickly perform "what if" experiments that otherwise would consume hours of calculating. Suppose you're thinking of selling your home, and wonder if it would be more advantageous in tax savings to sell it this year rather than next. Simply include the expected sale price in this and next year's cell of the Tax Matrix, and let Tax Planner compute the relults in each case. A quick comparison will reveal the more advantageous time for selling.

The Tax Planner incorporates current federal tax laws. In addition, if you fill out and mail the Registration Card that accompanies the program, Apple will keep you informed of any product changes corresponding to tax law revisions.

## SOME TECHNICAL INFORMATION

The Tax Planner is written in the Pascal language, but your Apple does not require the Language Card because the program is written in "run-time" Pascal.

For most users, a single Tax Planner diskette can store about 40 tax planning scenarios. Of course you may change or delete any stored scenario whenever you wish.

## THE TAX PLANNER PACKAGE

- Order No. A2D0040

With your Tax Planner order, you will receive:

- Two (2) Tax Planner diskettes (a master and a backup).
- The Tax Planner manual.
- User registration card.
- Customer license agreement.

## SYSTEM CONFIGURATION

- An Apple II or Apple II Plus, each with a minimum of 48 K of memory;
- one Apple Disk II with controller and 16 -sector PROMs;
- a video monitor or television;
- a printer and interface card (optional - you can still use the Tax Planner without using the PRINTER menu option).

## Business \& Professional Software, Inc. introduces <br> applegraph'

## for use with Apple* Computer Systems

apple $\mathbf{g r a p h}$ is a high-quality microcomputer software package for general purpose plotting of data in a variety of formats for use by the business, professional, and research decision maker.
apple graph yields high-resolution, multicolor graphics for video display and hardcopy output. Featured are pie charts generated separately or bar graphs, area plots, points, and solid or dashed lines produced in any combination of overlays.
apple graph features easy-to-use English language commands, making it $^{\text {t }}$ readily accessible to those unfamiliar with computers, as well as those who wish to add to their selection of decision-making tools.
Commands may be entered interactively or in advance for automatic presentation of an entire data analysis complete with mathematical manipulation, curvefitting, smoothing, and simple statistics.
Data may be entered directly or supplied from other programs.
apple Graph's many applications include:

- a forecasting tool for business and professional decision makers
- a teaching aid for educators
- a data analysis tool for researchers
- a visual aid for presentations
apple Graph will be available in January 1981.
For further information contact your local Apple dealer, or write:

## APPLEWRITER AND DOS TEXT FILES

by John Crossley and Jim Hoyt Apple Computer, Inc.

Now that Applewriter has been out awhile it occurs to me that it could be used for more than just writing letters. As a first step in this direction I thought that it would be nice to use Applewriter to edit text files and print them out nicely formatted.
When Applewriter saves a file to the disk, it saves an image of what's in memory with a BSAVE. This format is totally incompatible with DOS text files. So the easiest way to transfer is to READ the STET file one character at a time into memory and BSAVE it the way Applewriter does.

The Apple II slightly modifies the ASCII for its internal use by having the most significant bit on. Applewriter modifies this even more. The upper case letters are moved down to the inverse range, lower case letters are moved to where upper case letters belong and numbers and punctuation are moved to above either upper or lower case letters. Most text files contain straight or normal Apple ASCII so there is some code conversion required during the transfer. Since the transfer has to take place one character at a time, this doesn't cause any problems.

UC Upper Case letters
1c Lower Case letters
(\#) Lower Case letters in the Apple display as numbers
\# Numbers and punctuation
ctrl Control characters
cur The Applewriter cursor

The easiest way to work with DOS and put up pretty screens for the user is with a BASIC program. The easiest and quickest way to remap character sets is in machine language. So I chose to use a mix of the two. The Applesoft portion does the one-time job of the appropriate DOS commands and user prompts, and the machine language portion does the character transactions.
The normal way to read a text file into a BASIC variable is to OPEN, READ, and then INPUT the variable. That's exactly what I've done in the first program except instead of using the INPUT statement, I have substituted a machine language routine to convert the ASCII to Applewriter ASCII and store the converted character in memory. This continues until the routine requests one more character than there is in the file and DOS gives an OUT OF DATA error.

One of the first things the Applesoft portion does is to set up an ONERR routine. That routine gets control when the OUT OF MEMORY error happens. The ONERR routine CLOSEs the text file and POKEs an Applewriter end of file marker ( $\$ 60,96$ decimal) behind the last character in memory and BSAVEs the entire file to the disk. The Applewriter file is built where Applewriter would normally put it so you can quit at this point, run Applewriter, and start editing.

The program, as written, names the Applewriter the same name as the text file with 'TEXT.' prefixed.

This makes it easy to tell what files got converted to what new files.

# POKE SALAD 

by Tom Brown<br>Birmingham Apple Peel

## Using Applesoft ROM routines.

The first issue of Apple Orchard contained something I had been waiting for for a long timeApplesoft internal entry points. These are entry points to machine language routines within Applesoft (ROM card) for floating point operations, string manipulations, HI-RES graphics to name a few. After all, Applesoft is simply a giant machine language program. Most of these routines end in RTS (similar to RETURN in BASIC) so they can be used as subroutines from your own machine language programs. The following program is a result of my exploring these routines: a machine language dollar formatter.

When you want to print a number in dollar format from BASIC, you simply precede it with an " $\&$ ": eg. $10 \& X: \& Y: \& Z$. The numbers are printed out as a block of 10 characters and/or spaces, right justified, with a dollar sign and leading/trailing zeros as necessary. Negative numbers are also allowed.

Here's how it works. When Applesoft encounters an ' $\&$ ', it causes an immediate jump to location \$3F5. At this location we have stored the instruction "JuMP $\$ 300$ " which is the address of the formatter routine. This instruction is placed there by line 10 of the BASIC demo program. (This needs to be done only once). Now the formatter has control. FRMNUM is a routine which evaluates the number or expression (eg. $\mathrm{X}+3 / \mathrm{A}$ ) and places it in the Applesoft floating point accumulator. (By the way, the beauty of using these subroutines is that you don't have
to know how they work. You just set things up, do a JSR-Jump SubRoutine-and like magic, the operation has been performed). Next, we round off to two decimal places: multiply by 100 , add 0.5 , take the integer, and divide by 100 (lines 25-30). Note the routines used: MUL10 (mult. by 10), FADDH (add 0.5), INT (INTEGER), and

DIV10 (div. by 10). Next, FOUT converts the floating point representation of the number to an ASCII string and stores it beginning at $\$ 100$. This happens any time you print a number from Applesoft. Lines 32 to 90 format the string, and finally at line 91 we JSR STROUT ("string output") which is a routine that prints a string pointed to by $\mathrm{Y}, \mathrm{A}$. Note that in lines 95 and 96 we load $Y$ with $\$ 1$ and load $A$ with $\$ 00$ which will point STROUT to $\$ 100$ - the beginning of our string.

Of course, you could do all of this from within BASIC, but this routine is much faster (in some cases, faster than BASIC can print them unformatted!) and causes no "garbage" string buildup.

Try the following BASIC demo:
10 POKE 1013,76: POKE 1014,0: POKE 1015,3:REM SET UP‘\&'VECTOR
20 FOR I=-10 TO 10 STEP . 1
30 \&
40 NEXT
(Note: the numbers may range from 999,999.99 to -99,999.99)

You depend on good software to save you time and to have your computer help you do a job more efficiently. Our software is designed to do just that. We are one of the oldest companies supplying software for the Apple $\|^{*}$; and one of the very few that offers an unconditional guarantee of satisfaction or your money back! Here are a few that you'll want to add to your library:

## Super Terminal Software

ASCII EXPRESS II: The most complete communications package available for the Apple II. Designed for the most efficient transfer of data to or from practically any online computer. Fully supports upper/lower case, including characters normally unavailable: underscore, rubout, break, and most others. Keyboard macros allow you to define dual keystrokes as entire strings for fast signons, sign-offs, and system commands. A 20K data buffer allows for large files, and a convenient line editor means easy editing before and after transfer. Buffer can be output to printer, disk, or viewed at any time. Supports Micromodem II* and most other communication devices.
Price: $\$ 64.95$ on Disk. (Pre-Jan. 1 Price: $\$ 59.95$ )

## And for the $\mathbf{Z 8 0}$ Apple...

2-TERM: A flexible communications package for the Apple ॥ equipped with $Z 80$ Softcard* and the CP/M* environment. Allows file transfers to or from all types of dial-in systems. Fully supports Micromodem Il and most other communication devices, as well as 80 column display boards and external terminals! Utilizes standard CP/M sequential text files, with up to a 40 K internal buffer (using additional RAM or Language Card.) Supports multiple modes of data transfer and includes keyboard macros, autodial (with Micromodem II), and upper/lower case.
Price: $\$ 74.95$ on 16 sector diskette. (Available Jan. 1, 1981)

## Also available...

APPLE-DOC: A set of several utilities to speed up software development and customization. Vardoc makes a list of all the variables in a program and every line on which they occur. Also allows you to create a list of descriptors of what each one does. Linedoc makes a similar list for each line/subroutine called by a GOTO, GOSUB, etc. Condoc is similar but documents all numeric constants - great for scientific \& business uses! Replace is a powerful replacement editor which makes changing any occurance of a variable or group of statements a breeze!
Price: $\$ 34.95$, Disk. (Available Jan. 1, 1981)
THE CORRESPONDENT: An extremely versatile program! Designed primarily for writing letters and other documents in a very visual way. The Apple screen acts as a "window" onto a 40-80 column page. 4-directional scrolling lets you see any part of the page just as it will be printed. Editor functions include full upper/lower case \& control chars., block move/copy, split screen option, even math functions! Additional utilities \& uses include printing form letters, a free-form database, putting bi-directional scrolling in your own programs, single-disk copy program, DOS remove for greater storage on diskettes, and more!

Price $\$ 44.95$ on disk.
All programs require 48 K and Applesoft in ROM or language card. Specify DOS 3.2 or 3.3 . California residents add $6 \%$ to all prices.

See these and other S.D.S. products at your local dealer, or for more information, write or call:

COMPUTER STATION proudly offers a high－speed binary video digitizer for the Apple II called the DITHERTIZER II．The peripheral board uses a video camera with external sync to load the hi－res page of the Apple with any image the camera can capture．The DITHERTIZER II is a frame grabber， DMA type digitizer requiring only $1 / 60$ th of a second to capture a binary image．Software supplied with the board enables building dithered images and capturing image intensity contours．Intensity and contrast are user controllable via the game paddles．Matrix size for dithering changable with one keystroke．Requires video camera with external sync；recommended model，Sanyo
VC1610X．
DI＇THERTIZER II，$\$ 300$ ； $\mathrm{B} / \mathrm{W}$ SANYO VIDEO CAMERA，$\$ 410$
PACKAGE OF DITHERTIZER II AND CAMERA，\＄650．
GRAPHICS DUMPS：
Computer Station offers the highest degree of human engineering on the market for hard copy graphics from the hi－res pages of the Apple．The following machine language dump routines are available for BASIC：
IDS440G／445G＊$\$ 44.95$
IDS460G＊ 44.95
ANADEX $9501 \quad 44.95$
NEC SPINWRITER $5510 \quad 44.95$
NEC SPINWRITER 5520
$*=$ Also available for use with Pascal，$\$ 44.95$
APPLEWRITER GRAPHICS：
Hard copy of character sets found in DOS Tool Kit for use with Applewriter or print statements in your own programs． Requires DOS 3．3，DOS Tool Kit，one of graphic printers below：
Silentype
IDS440G／445G 34.95
VISILIST $\$ 24.95$
Get hard copy of the FORMULAS used in VISICALC models． Prints grid location，contents（formulas or labels），and global parameters．Handy utility for all VISICALC users．

#  <br> Jefferson had one of the best minds of 1776, but today you can make better decisions with an Apple. 

Jefferson and decision makers of every century have faced the same challenge: how to explore every option before you implement the final plan. Today you have a solution. The Apple personal computer.

## A tool to test contingencies.

How would higher interest rates affect your forecasts? What if vendors raised prices $2 \%$ ? What if you could determine capital equipment depreciation at the touch of a key? Now, you can productively test your assumptions with ease by using the Apple system that sits on your desk.

## Declare your independence with Apple.

The same Apple system that helps you forecast saves you more time by tackling word-related tasks, too. Apple helps you write reports. Print letters. With Apple's text-
editing capabilities, it might not have taken Jefferson 17 days to draft the Declaration of Independence.

## Personal advice on personal computers.

Today, the power and versatility of a $\$ 15,000$ computer are at your fingertips with a complete Apple system solution for $\$ 2,300$ to $\$ 7,800$. It's computing made easy and economical. A few minutes with your Apple dealer and you'll understand how powerful the Apple computer can be.

Your dealer will guide you through Apple's extensive line of hardware and software solutions, and he'll prove that all personal computers are not created equal. Don't let history pass you by. Visit your nearest Apple dealer, or call 800-538-9696. In California, 800-662-9238. Or write: Apple Computer, 10260 Bandley Drive, Cupertino, CA 95014.

## applecomputer inc.

# VersaWriter 

# High-Resolution Color Graphics for Apple II or Apple II Plus 

We have used the VersaWriter to draw a picture of itself. Text may be added in any size or direction.

The VersaWriter graphics tablet lets you create multicolor graphics and drawings with your Apple computer. It compares in quality to graphic bit pads and digitizers costing three times more money.
VersaWriter is a digitizer and software package which presents a new approach to hi-res graphics. It consists of a mylar plotting board with a clear plastic overlay. Attached to this board is the drawing arm, which has a magnifying lens with a crosshairs at its end. You simply place any graph, picture or drawing (up to $81^{1 / 2 "} \times 11^{\prime \prime}$ ) under the plastic overlay and "trace" it with the drawing arm. As you trace the drawing appears on the video screen.

The superior software of the VeraWriter enables you to do much more than just trace. Immediate commands include: color choice, brush size (the width of the drawing line), fill figure with color, draw a straight line between two points, use a different scale for drawing (. 25 to 4), edit, erase, smothing factor (rounds off the rough edges as you draw), store picture on disk, and more.
One exceptional feature of the VersaWriter is the Shape Table function. You can take any picture,
or portion of a picture, and store it as a shape table. Then the table can be recalled from memory and placed on any part of the screen. You can change the size of the image, rotate it, add to it, etc. By incorporating a series of images into a single shape table, commonly used symbols can be easily inserted into a variety of different programs. VersaWriter software includes an Electronic Drawing program which is a shape table of common schematic symbols-this program will give you a good idea of what the shape table can do, as well as let you easily produce electronic or logic diagrams.

Other programs included in the software are: the Textwriter, with which text can be added to graphics (UPPER \& lower case, choice of color, text size, direction of text, starting point of text). Area/Dis-tance-this program allows you to calculate distances (or perimeters) by establishing a measuring unit (of your choice) and tracing the shape or map route with the drawing arm. Areas of figures are calculated in the same way-this includes irregular and open figures. A very simple calibration program is also on this software disk.
A second software disk contains

VersaWriter demonstration programs. For more advanced use of high-res graphics, there is a skeleton program which contains the guts of the VersaWriter. The VersaWriter is a sturdy peripheral device which plugs into the game paddles I/O port-the VersaWriter does not use up a card slot in the Apple computer. Also, the VersaWriter is not subject to the grounding problems and strong magnetic field problems of other, more expensive, hi-res graphic devices.
Versa Writer requires an Apple II with Applesoft in ROM (or an Apple II Plus), Disk, and a least 32 K of memory.

VersaWriter comes complete with $81 / 2$ " $\times 11$ "drawing surface, plastic overlay and two disks of software. Price $\$ 252.00$ postpaid in continental USA. VersaWriter has a 90-day warranty on parts and labor.
Credit card customers include card number and expiration date of your Visa, Mastercard or American Express card. No C.O.D.'s. Bankcard customers may order toll-free to:

# USING USR 

by<br>Frank Evans<br>PAN/TECHNOLOGY

Reprinted from: Stems from A.P.P.L.E.
August-September, 1980

Apple Portland Program Library Exchange

Applesoft, like most BASIC implementations now in use, provides two methods of linkage to machine language routines. The simplest is a straight procedure call with no arguments passed or value returned, the CALL. If arguments are to be passed, pre POKEing them to fixed RAM locations before a CALL, and PEEKing to get the results works for simple arguments, but it involves three function invocations and the attendant overhead. A simpler and more direct method is implemented in the USR(ARG) function call. USR is a function (not a procedure) in that it requires that an argument be provided and USR must be evaluated in an expression, since it returns a value.
The argument for USR is handled the same as any other function argument. A single value, a literal constant or variable may be used, and an expression which may contain other function calls is also allowed. Thus to pass an argument, no special preparation to turn it into POKEable bytes is needed; any "number" will do. The argument is evaluated by the interpreter in floating point format and is left in the Floating Point Accumlator (hereafter FPA) which is located at $\$ 90$ thru \$A3. The seven bytes left there are in floating point format for use by the machine language routine. Mixed expressions of
integer and real arguments are properly handled in the conversion as long as the value does not go out of range.

The machine language routine returns to BASIC with a RTS. In returning to BASIC, the function USR (ARG) assumes the value which is found in the FPA just before the RTS. Thus the machine language routine simply puts its results (in real form) in the FPA. The assignment of USR (ARG) to a value requires that it appears in an expression in the BASIC program which invokes the function. Thus:

## 10 X=USR(Y) 20 PRINT USR(Y), Y $30 \mathrm{~S}=\operatorname{SIN}\left(\right.$ USR $\left.(\mathrm{A}+7)^{*} 60\right)$

are acceptable forms but,

```
40 USR(Y) = X**2
50 INPUT USR(X)
60 FOR USR(I) = 0 TO 10
```

are not acceptable calls. One form, 70 CALL USR(A)
is acceptable but USR is expected to calculate an address for subsequent procedure invocation, a function best done entirely in machine code.

The linkage to machine language must be set up by the programmer. When invoked, USR does its housekeeping as described above, then jumps to $\$ 0 \mathrm{~A}$. At $\$ 0 \mathrm{~A}$ there are three bytes of space for the
machine language program. The intent of the APPLE programmers was to have the user place a JMP USER instruction there to get to the real code, but an RTS placed at \$0A would produce a .NUL USER function. Once the processor reaches the start of the machine code (at USER) the real work can begin. The machine status and the A register need not be maintained but there is no quarantee of machine state (ie. DEC mode may be set). The code proceeds and need only terminate in an RTS to link back to BASIC.

There are two monitor routines which are very useful in handling integer arguments. If the machine code desires an integer argument, the FPA can be converted to a 16 bit integer by a call, JSR \$E10C, which "fixes" the FPA to two bytes at \$A0 (high byte) and \$A1 (low byte). If an integer result (or just a byte) is to be passed to BASIC, the two bytes may be placed in the A register (high byte) and the Y register (low byte) and, JSR \$E2F2 is executed. This "floats" the 16 bit integer to real format in the FPA. If this is the last event in the machine code (just prior to the RTS exit), the JSR may be replaced by a JMP instruction which then uses the RTS at the end of the float routine to return to BASIC.

The programmer is responsible for making space for his routines and protecting them from system RAM uses. The reader is referred to the manuals for HIMEM: and page 30 for descriptions for possible methods of protection. The USR function can be a very powerful extension of BASIC. Peripheral drivers can be implemented and special calculation routines developed for high speed processing. Multiple USR functions can be installed and one function activated at a time by POKEing different target addresses in $\$ 0 \mathrm{~B}$ and $\$ 0 \mathrm{C}$. In addition to illustrating the concepts of this article, the following example shows a method of access to text files from machine language.

## THUNDERCLOCK PLUS

## A REAL-TIME CLOCK/CALENDAR

- Provides month, date, day-of-week, hour, minute, and second
- Software selectable time formats: 24 hour or AM/PM ASCII string, or as numeric values
- Provides interrupts which can be enabled or disabled under software control
- On board battery allows accurate timekeeping for up to 2 years even with your APPLE turned off

AVAILABLE NOW!
TO ORDER TOLL FREE (VISA/MC) CALL: 800-227-6204 Ext. 307 (Outside California) 800-632-2131 Ext. 307 (California Only)

## AN INTERFACE FOR THE BSR X-10

- Control AC outlets with your BSR Command Console and APPLE II
- All 22 BSR commands at your program's fingertips
- Up to 128 separate dim/bright levels
- THUNDERWARE'S Scheduler software will control AC outlets in the background, while you run another program in the foreground

# PUT TIME AND BSR CONTROL IN YOUR APPLE II 

## BOTH FEATURES ON ONE CARD

- On-board firmware makes the THUNDERCLOCK PLUS ${ }^{\text {TM }}$ exceptionally easy to use
- Read or set time, control interrupts, and send BSR commands with simple BASIC 'INPUT' and 'PRINT' statements
- Completely APPLE II compatible: INT and FP BASIC or PASCAL with Unit support
- Special introductory prices end Jan 15, 1981

THUNDERCLOCK PLUS..... $\qquad$ . $\$ 119.00$
Clock, BSR interface, and User's manual

## NOWTHESOCARDCA taky youbiondinaics. <br> You probably know about the SoftCard-our ingenious circuit card that converts an Apple $I^{®}$ into a Z-80® machine running CP/Me <br> You may even know that with the SoftCard, you get Microsoft's powerful BASIC- extended to support Apple graphics and many other features. <br> Now, whenever you're ready to get beyond the BASICs, the SoftCard can take you into whole new realms. Starting with two advanced language packages from Microsoft. <br> optimization, and, since it doesn't require a "Pcode" interpreter at run time, your programs will typically execute 2-3 times faster than with Apple FORTRAN. <br> FORTRAN is easy to learn if you know BASIC, and the package includes a huge library of floating point, math, and I/O routines you can use in all your programs

\section*{FORTRAN AND

## FORTRAN AND COBOLTO GO.

Now you can run the world's most popular engineering/scientific language and the most popular business language on your Apple. Think what that means: you can choose from literally thousands of "off-the-shelf" applications programs, and have them working with little conversion. Or design your own programs, taking advantage of all the problemsolving power these specialized languages give you:

## FORTRAN-80

A complete ANSI-standard FORTRAN (except COMPLEX type), with important enhancements. The extremely fast compiler performs extensive code

## COBOL-80

Virtually the only choice for serious business data processing It's ANSI 1974 standard COBOL, with many user-oriented features added: formatted screen support for CRT terminals, simple segmenting of very large programs, powerful file handling capability, trace debugging, and much more. A separate Sort package is coming soon.

FORTRAN-80 and COBOL-80 are just two more reasons why the Apple with SoftCard is the world's most versatile personal computer. Get all the exciting details from your Microsoft dealer today: And start getting beyond the BASICs

MICROSOFT Consumer Products, 400 108th Ave. NE., Suite 200, Bellevue, WA 98004. (206) 454-1315.

RATINGS
Speed: 75
Ease of Use: 85
Documentation: 80
Error Comments: 85
Screen Display: 90
Reliability: 90
Average: 84
Games have always been one of the strong points of the Apple, and with the Apple's graphic and sound capabilities, it is no wonder. Most of the games that have been written are of the action, or arcade style. Other than the chess games that are around, little in the way of strategy games have been available. Recently, however, strategy type games have begun to appear. One of these is Galaxy Space War I.

The Apple is actually very well suited for the task of strategy game playing. Not only does it have the graphics to display the playing board, but also the power to calculate and display the results of conflicts. In addition, the Apple can be one's opponent when no human is near and when the urge to play arises.

Space War I is set in a space type atmosphere, with your objective to destroy your opponents 'Galaxy' and thus win the game. The beauty of Space War I is that it is easy, yet challenging to play. After reading the manual, one can begin to play in about twenty minutes although it may take several games until one feels completely comfortable with all of the twentyodd commands.

Throughout the course of the game, one is presented with a hi-res map of the galaxy. This map consists of a $33 \times 17$ grid, with each player's base in the middle of each end of the grid. Each player is able to build, move, and attack in a day [turn]. The key to the game lies in the shields, or screens, as they are known in the game. Depending on the setting of these screens, it will determine how much attack energy one will have, how far one can move, as well as the distance at which one can detect the enemy.

A couple of problems arise while playing the game. First off, since the game uses the same symbols, but different colors, for the playing pieces, it makes it very difficult to determine who is who with a black and white monitor or TV. Another thing that is annoying is that when playing against the computer, it may take a few minutes for the computer to complete its turn. This is not so bad when comparing this with some of the other strategy games, but does alter the flow of the game (Hasn't anyone ever heard of machine language?).

In summary, Galaxy Space War I offers a nice package. One can construct their own scenarios, either against the computer or another player. Additionally, it takes little time to learn how to play, and offers the variety to keep one's attention at the Apple's screen. If you are looking for a good strategy game that will keep you thinking, then Galaxy Space War I is for you.

## GALAXY SPACE WAR I

#### Abstract

Galaxy Space War 1 (WAR1) is a game of strategy in which the player has complete control of his space fleet's tactical maneuvers. Each fleet battles its way toward the opponents galaxy in an attempt to destroy it and win the war. WAR1 simulates the actual environment encountered in a space war between two galaxies. Optimum use is made of Apple's high resolution graphics (HIRES) and colors in displaying the twinkling stars universe, the colored ships of each fleet. Iong range sensors colored illuminations, and the alternating blinking colors used in battles between ships. Complementing HIRES are the sounds of war produced by Apple's speaker.

WAR1 is played between Apple and a player or between two players. You may play with total knowledge of each others fleet or only ships sensor knowledge of the opponents fleet. Each player builds his starting fleet and adds to it during the game. This building process consists of creating the size and shape of each ship. positioning it, and then allocating the total amount of energy for each ship.

During a player's turn he may dynamcially allocate his ships total energy between his screen/detection and attack/move partitions. The percentage of the total energy allocated to each partition determines its characteristics. The screen/detection partition determines how much energy is in a ship's screens and the detection sector range of its short range sensors. The attack/move determines the amount of energy the ship can attack with, its attack sector range, and the number of sectors it can move in normal or hyperspace.

When an enemy ship is detected by short range sensors, it is displayed on the universe and a text enemy report appears. The report identifies the ship, its position. amount of energy in its screens, probable attack and total energy, a calculated detection/attack/move range, and size of the ship. Also shown is the number of days since you last knew these parameters about the ship. When a ship's long range sensor probes indicate the existence of an enemy presence at a sector in space, this sector is illuminated on the universe. An enemy ship is attacked and destroyed with attack energy. If your attack energy breaks through his screens, then his attack energy is reduced by two units of energy for every unit you attack with. A text battle report is output after each attack. The program maintains your ship's data and the latest known data about each enemy ship. You may show either data in text reports or display the last known enemy positions on the universe. You can also get battle predictions between opposing ships. The text output calculates the amount of energy required to destroy each ship for different energy allocations.

Turn your electric typewriter into a low cost, high quality hard copy printer. 1 Year Warranty

Dynatyper-the patented* RDI-I / O Pak is fast becoming the industry standard for typewriter output. Why? Because:

1. It takes 2 minutes to initially install and 5 seconds to remove or replace.
2. You do not have to modify your typewriter. All factory warranties and maintenance agreements on your typewriter will be honored.
3. You can use it with all powered carriage return typewriters that have U.S. keyboard. Our Model I works with all non Selectrics and our Model II works with Selectrics. Conversion between models takes 2 minutes and the kit ( 26 plungers) is available for a nominal charge.
4. You don't have to lug around a bulky printer when you travel. If there is a typewriter at your destination, you can install the light (3 lbs.) I/O Pak in just 2 minutes.
5. Same interface for TRS-80, Apple and GPIB. Centronics and Pet compatible interfaces are available in third quarter 1980. Electric pencil available.
6. Delivery: Stock to two weeks. Price: $\$ 499$. for the complete system, FOB Rochester, Domestic.
Over 1000 in operation today. VISA and MasterCard accepted. Call Ken Yanicky at 716-442-7804.

## Apple PIE

Apple PIE (Programma International Editor) and FORMAT (text formatter) offer full strength solutions to today's word processing problems. These versatile, powerful programs provide document preparation and word processing capabilities previously found only on much larger computer systems.

PIE is a general purpose, full screen editor that uses control keys and function buttons to provide a full range of editing capabilities such as search and replace, delete, copy, insert, move. Changes may be made directly anywhere on the screen and are shown as they-are performed.

FORMAT uses simple instructions embedded in the input text to describe the desired appearance of the final document. It handles centering, underlining, indenting, page numbering,
margins, headers, footers, even form letters, and includes a proofing capability.

These high-quality, cost-effective programs come with comprehensive documentation and run on a 32 K Apple II. They are available through your local computer store or direct from Programma International, Inc. at the introductory price of $\$ 79.95^{*}$
